# 1. Scope

The SyncML Initiative, Ltd. was a not-for-profit corporation formed by a group of companies who co-operated to produce an open specification for data synchronization and device management. Prior to SyncML, data synchronization and device management had been based on a set of different, proprietary protocols, each functioning only with a very limited number of devices, systems and data types. These non-interoperable technologies have complicated the tasks of users, manufacturers, service providers, and developers. Further, a proliferation of different, proprietary data synchronization and device management protocols has placed barriers to the extended use of mobile devices, has restricted data access and delivery and limited the mobility of the users.

SyncML is a specification that contains the following main components:

- An XML-based representation protocol
- A synchronization protocol and a device management protocol
- Transport bindings for the protocol

The data representation specifies an XML DTD that allows the representation of all the information required to perform synchronization or device management, including data, metadata and commands. The synchronization and device management protocols specify how SyncML messages conforming to the DTD are exchanged in order to allow a SyncML client and server to exchange additions, deletes, updates and other status information.

There are also DTDs which define the representation of information about the device such as memory capacity, and the representation of various types of meta information such as security credentials.

Although the SyncML specification defines transport bindings that specify how to use a particular transport to exchange messages and responses, the SyncML representation, synchronization and device management protocols are transport - independent. Each SyncML package is completely self-contained, and could in principle be carried by any transport. The initial bindings specified are HTTP, WSP and OBEX, but there is no reason why SyncML could not be implemented using email or message queues, to list only two alternatives. Because SyncML messages are self-contained, multiple transports may be used without either the server or client devices having to be aware of the network topology. Thus, a short-range OBEX connection could be used for local connectivity, with the messages being passed on via HTTP to an Internet-hosted synchronization server.

To reduce the data size, a binary coding of SyncML based on the WAP Forum's WBXML is defined. Messages may also be passed in clear text if required. In this and other ways SyncML addresses the bandwidth and resource limitations imposed by mobile devices.

SyncML is both data type and data store independent. SyncML can carry any data type which can be represented as a MIME object. To promote interoperability between different implementations of SyncML, the specification includes the representation formats used for common PIM data.

## 3. Terminology and Conventions

### 3.1 Conventions

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

All sections and appendixes, except “Scope” and “Introduction”, are normative, unless they are explicitly indicated to be informative.

Any reference to components of the SyncML DTD or XML snippets is specified in this `typeface`.

### 3.2 Definitions

<b>Cache</b>	A program's local store of response messages and the subsystem that controls its message storage, retrieval, and deletion. A cache stores cacheable responses in order to reduce the response time and network bandwidth consumption on future, equivalent requests. Any client or server can include a cache, though a cache cannot be used by a server that is acting as a tunnel.
<b>Cacheable</b>	A response is cacheable if a cache is allowed to store a copy of the response message for use in answering subsequent requests. The rules for determining the cacheability of HTTP responses are defined in section 13 of [RFC2616]. Even if a resource is cacheable, there can be additional constraints on whether a cache can use the cached copy for a particular request.
<b>Connection</b>	A transport layer virtual circuit established between two programs for the purpose of communication.
<b>Content Negotiation</b>	The mechanism for selecting the appropriate representation when servicing a request, as described in section 12 of [RFC2616]. The representation of entities in any response can be negotiated (including error responses).
<b>Entity</b>	The information transferred as the payload of a HTTP request or HTTP response. An entity consists of meta-information in the form of entity-header fields and content in the form of an entity-body, as described in section 7 of [RFC2616].
<b>HTTP Client</b>	A program that establishes connections for the purpose of sending HTTP requests.  NOTE: In this document, when the term "client" appears alone, it refers to a HTTP client, not a SyncML client.
<b>HTTP Gateway</b>	A HTTP server which acts as an intermediary for some other server. Unlike a proxy, a gateway receives requests as if it were the origin server for the requested resource; the requesting client might not be aware that it is communicating with a gateway.
<b>HTTP Message</b>	The basic unit of HTTP communication, consisting of a structured sequence of octets matching the syntax defined in section 4 of [RFC2616] and transmitted via the connection.
<b>HTTP Proxy</b>	An intermediary program which acts as both a server and a client for the purpose of making requests on behalf of other clients. Requests are serviced internally or by passing them on, with possible translation, to other servers. A proxy MUST implement both the client and server requirements of this specification. A "transparent proxy" is a proxy that does not modify the request or response beyond what is needed for proxy authentication and identification. A "non-transparent proxy" is a proxy that modifies the request or response in order to provide some added service to the user agent, such as group annotation services, media type transformation, protocol reduction, or anonymity filtering. Except where either transparent or non-transparent behavior is explicitly stated, the HTTP proxy requirements apply to both types of proxies.
<b>HTTP Request</b>	An HTTP request message, as defined in section 5 of [RFC2616].
<b>HTTP Response</b>	An HTTP response message, as defined in section 6 of [RFC2616].

<b>HTTP Server</b>	An application program that accepts connections in order to service HTTP requests by sending back responses. Any given program might be capable of being both an HTTP client and a server; our use of these terms refers only to the role being performed by the program for a particular connection, rather than to the program's capabilities in general. Likewise, any server might act as an HTTP origin server, proxy, gateway, or tunnel, switching behavior based on the nature of each request. NOTE: In this document, when the term "server" appears alone, it refers to a HTTP server, not a SyncML server.
<b>Inbound/Outbound</b>	Inbound and outbound refer to the request and response paths for messages: "inbound" means "traveling toward the origin server", and "outbound" means "traveling toward the user agent."
<b>Representation</b>	An entity included with a response that is subject to content negotiation, as described in section 12 of [RFC2616]. There can exist multiple representations associated with a particular response status.
<b>Resource</b>	A network data object or service that can be identified by a URI, as defined in section 3.2 of [RFC2616]. Resources can be available in multiple representations (e.g. multiple languages, data formats, size, and resolutions) or vary in other ways.
<b>User Agent</b>	The client which initiates a request. These are often browsers, editors, spiders (web-traversing robots), or other end user tools.
<b>Origin Server</b>	The HTTP server on which a given resource resides or is to be created.
<b>Tunnel</b>	An intermediary program which is acting as a blind relay between two connections. Once active, a tunnel is not considered a party to the HTTP communication, though the tunnel might have been initiated by an HTTP request. The tunnel ceases to exist when both ends of the relayed connections are closed.
<b>Variant</b>	A resource might have one, or more than one, representation(s) associated with it at any given instant. Each of these representations is termed a "variant". Use of the term "variant" does not necessarily imply that the resource is subject to content negotiation.
<b>Upstream/Downstream</b>	Upstream and downstream describe the flow of a message: all messages flow from upstream to downstream.

### 3.3 Abbreviations

<b>HTTP</b>	Hypertext Transfer Protocol [RFC2616]
<b>OMA</b>	Open Mobile Alliance
<b>SSL</b>	Secure Socket Layer [SSL]
<b>TLS</b>	Transport Layer Security [RFC4346]
<b>URI</b>	Uniform Resource Identifier [RFC2396]
<b>URL</b>	Uniform Resource Locator [RFC2396]
<b>WAP</b>	Wireless Application Protocol
<b>WBXML</b>	WAP Binary XML Content Format
<b>XML</b>	Extensible Markup Language

## 4. Introduction

This document defines the binding requirements for communicating SyncML over the Hypertext Transfer Protocol (HTTP) as defined by [RFC2616]. HTTP is an application-level protocol for distributing information between two Internet based applications. HTTP can be an ideal protocol for building wide area, distributed systems, such as the collaborative framework of the World-Wide Web (Web) environment. HTTP is expected to be the primary wireline protocol used by SyncML clients and servers to communicate with each other. In addition, as wireless networks increase in bandwidth (e.g., deployment of GPRS networks) and are adapted to support the IP protocol, HTTP will become the preferred application protocol for connecting wireless SyncML clients and servers.

The HTTP protocol defines a request/response form of communication between two network computers supporting HTTP applications. Normally, the originator of the request is called the HTTP client. And normally, the recipient of the request is called the HTTP server.

There are emerging Internet standards for notification or "push" technologies that will allow HTTP servers to also originate HTTP requests. However, this technology is not currently included in this version of the specification.

HTTP is an ideal protocol for connecting a SyncML client to a SyncML server; and vice a versa. Several MIME media types have been registered for SyncML. This makes it adapted for transfer over HTTP. HTTP is widely supported across the Internet. There are numerous examples of common implementations of both client and server HTTP applications. HTTP servers can be adapted to support new HTTP-based application in a straightforward manner. SyncML messages can be transferred across the Internet and pass through "firewalls", at the perimeter of individual intranets with relative ease.

HTTP communication usually takes place over a TCP/IP connection. The default TCP port for HTTP is port 80, the default port for HTTPS / SSL / TLS is 443, but other unregistered ports can also be used. HTTP can also be implemented on top of any other reliable transport service.

An HTTP request message consists of start line containing a request method, target URI, and protocol version; followed by a MIME-like request header lines containing meta-information about the request; followed by a blank line; followed by a possible MIME entity body content. The server responds with a status line, including the message's protocol version and a response code; followed by MIME-like response header lines containing server information and entity meta-information; followed by a blank line; followed by an optional MIME entity body content.

## 5. HTTP Bindings

The following sections define the requirements for the binding of SyncML to HTTP.

### 5.1 TCP Transport Service

HTTP communication usually takes place over a TCP connection. This binding does not require, but does assume such a connection. If the HTTP communication takes place over another transport service, then requirements similar to those defined here for TCP need to be followed. The following sections describe requirements for connection, disconnection and abort of the TCP connection.

#### 5.1.1 Connection

Prior to an HTTP client connecting to an HTTP server, the SyncML client makes a TCP connection using the TCP open operation between the client machine and the server machine. The client can use the Internet address resolution for the HTTP connection URL. The default port is 80. However, another port can be used. The choice of the appropriate port can be a requirement of the provisioning of the HTTP client to the HTTP server. After creating a successful TCP connection between the client and server machines, the HTTP connection between the client and server machines can be established by the SyncML client. It cannot be assumed that the TCP connection is kept open between each HTTP request and response sequence (i.e., HTTP version 1.1 or higher protocol is being used). Even though HTTP version 1.1 presumes persistent connections, there can have occurred an anomaly such as a timeout condition or "denial of service" counter-measures on the origin server. Hence, the SyncML client SHOULD be prepared for reconnection between HTTP requests.

#### 5.1.2 Connection Options

The default port is 80. However, the provisioning of the HTTP client to the HTTP server can require use of another port.

Persistent connections are supported by this specification and presumed by HTTP version 1.1, but are not REQUIRED by implementations conforming to this specification.

#### 5.1.3 Disconnection

The SyncML client is responsible for terminating the connection with a TCP close operation, when the connection is no longer needed.

If a persistent connection exists between HTTP requests, the HTTP connection is closed by the HTTP client after receipt of the HTTP response corresponding to the last SyncML request in the synchronization session (i.e., the SyncML request in the last SyncML package containing a Final element type specified at the end of the SyncBody).

#### 5.1.4 Abort

Sometimes abnormal conditions arise which requires an application to break the TCP connection. In these cases, the TCP reset operation is initiated to terminate the TCP connection.

#### 5.1.5 Timeouts

In the case of a server timeout, the SyncML client SHOULD establish a new HTTP session with the HTTP server and attempt to resend the current SyncML package, beginning with the first SyncML command for which the SyncML client has not received an acknowledgement. In the event that the SyncML client requested that no responses be sent, the SyncML client SHOULD begin retransmitting with the first SyncML command in the SyncML package.

In the case of a client timeout during a SyncML client-initiated data synchronization, the SyncML server SHOULD clean up the TCP connection and do no further processing of the SyncML request.

## 5.2 Exchanging SyncML Messages

Once an HTTP connection has been established, one or more SyncML Message are transferred over the connection, by the SyncML client, in the entity body of HTTP requests or received from the server in the entity body of HTTP responses.

The POST method is used to transfer the SyncML message in an HTTP request.

The body of the HTTP request MUST always include a SyncML message. The content-type for the body MUST be the appropriate SyncML Message content type.

Generally, the Request-URI, in the start line, is the URI "path" component of the intended recipient resource for the request. The URI of the origin server is specified by the value in the Host request header.

The Request-URI can also be "\*" to indicate that the request is intended for the origin server indicated by the absolute URI specified in the Host request header. In this case, the origin server would be the SyncML server. However, in general, the SyncML server will be a resource (e.g., servlet) under the origin server.

The HTTP response will always include the transport response status code. The body of the HTTP Response MUST always include a SyncML Message. The content-type for the body SHOULD be the appropriate SyncML message content type.

### 5.2.1 Single Message Per Package

The following is a snippet of the minimal HTTP start line and request headers for a simple HTTP request where the body of the request is the clear-text, XML [XML] SyncML message media type.

```
POST ./servlet/syncit HTTP/1.1
Host: www.datasync.org
Content-Type: application/vnd.syncml+xml; charset="utf-8"
Content-Length: 1023
Accept: application/vnd.syncml+xml
```

Were the body, the binary, WBXML [WBXML] SyncML message media type, then no content encoding is necessary. HTTP does not support the Content-Transfer-Encoding of MIME, in any case.

The following is a snippet of the minimal HTTP for an example for a simple HTTP response where the body in the response is the clear-text, XML [XML] SyncML message media type, as specified in the Accept request header in the HTTP request.

```
HTTP/1.1 200 OK
Content-Type: application/vnd.syncml+xml; charset="utf-8"
Content-Length: 1023

-- HTTP body, represented in a format consistent with the SyncML
content type follows --
```

### 5.2.2 Multiple Messages Per Package

Each SyncML message MUST be transferred as a SyncML MIME media type within the body of a HTTP request or response. When there are multiple SyncML messages per SyncML package, each message is transferred in a separate HTTP request or response; depending on whether it is a SyncML request or response.

The recipient of a SyncML package can determine if there are more SyncML messages in the package by the absence of the Final element in the body of the last received SyncML message. When the recipient receives a SyncML message with the Final element, it is the final message within that SyncML package.

This version of the specification does NOT support transferring SyncML messages across HTTP using a "multipart" MIME media type.

## 5.3 Transport Commands

HTTP uses a number of types of commands. The following sections specify static conformance requirements for use of these commands in the SyncML HTTP binding.

Static conformance requirements (SCR) specify the features that are OPTIONAL, mandatory and RECOMMENDED within implementations conforming to this specification.

Simple tables are used to specify this information

In these tables, OPTIONAL features are specified by a "MAY", mandatory features are specified by a "MUST" and RECOMMENDED features are specified by a "SHOULD", as defined in [RFC2119].

An implementation which does not include a particular option, MUST be prepared to interoperate with another implementation, which does include the option, though perhaps with reduced functionality.

### 5.3.1 Methods

The following table summarizes the support for the HTTP methods in the SyncML binding.

Method	Client Requirements	Server Requirements
OPTIONS	MAY	MAY
GET	MAY	MAY
HEAD	MAY	MAY
POST	MUST	MUST
PUT	MAY	MAY
DELETE	MAY	MAY
TRACE	MAY	MAY
CONNECT	MAY	MAY

The SyncML client MUST use the POST or MAY use the CONNECT method (if supported) to send SyncML requests to the SyncML server. The CONNECT method is used to initiate an SSL [SSL] / TLS [RFC4346] session to authenticate the HTTP client to the HTTP server. A typical HTTP request start line would look like the following:

```
POST ./servlet/syncit HTTP/1.1
Host: http://www.syncml.host.com
```

In this example, the HTTP client is specifying a "./servlet/syncit" path component for the Request-URI, which is a particular SyncML resource on the HTTP server. The "Host" HTTP header field is needed to specify the absolute URI for the HTTP server.

The other HTTP methods MAY be supported by implementations conforming to this specification. However, they are not used at this time by the SyncML client.

### 5.3.2 General Headers

The following table summarizes the support for the HTTP general headers in the SyncML binding.

General Header	Client Requirements	Server Requirements
Cache-Control	MUST	MUST
Connection	MAY	MAY
Content-Encoding	MAY	MAY
Date	MAY	MAY
Pragma	MAY	MAY
Trailer	MAY	MAY
Transfer-Encoding	MUST	MUST
Upgrade	MAY	MAY

Via	MAY	MAY
Warning	MAY	MAY

The Cache-Control general header is used to force control over the caching mechanisms in the request/response chain between the HTTP client and the HTTP server. Implementations conforming to this specification MUST support this header. Use of this header with the no-store parameter will assure that SyncML messages sent by the SyncML client and SyncML server are not stored in cache storage. This will greatly assure that SyncML server and SyncML client are processing the messages sent by the SyncML clients and SyncML servers, respectively. The following is an example of the typical specification for this header:

```
Cache-Control: no-store
```

In addition, implementations conforming to this specification MUST support the private Cache-Control option to assure that responses do not get cached and possibly used by agents other than the SyncML client agent or the SyncML server agent.

```
Cache-Control: private
```

The Content-Encoding header is used as a modifier to the media-type. When present, its value indicates what additional content coding have been applied to the entity-body, and thus what decoding mechanisms must be applied in order to obtain the media-type referenced by the Content-Type header field. Content-Encoding is primarily used to allow a document to be compressed without losing the identity of its underlying media type. Implementations conforming to this specification MAY support Content-Encodings other than identity. Note that since SyncML messages are frequently used in bandwidth constrained environments, the use of compression may be especially desirable. The following is an example of how this header is specified to indicate that gzip compression was used on the message.

```
Content-Encoding: gzip
```

The Transfer-Encoding general header is used to indicate what (if any) type of transformation has been applied to the message body in order to safely transfer it between the sender and the recipient. Implementations conforming to this specification MUST support the chunked Transfer-Encoding option.

```
Transfer-Encoding: chunked
```

The other general headers MAY be supported by implementations conforming to this specification.

### 5.3.3 Request Headers

The following table summarizes the support for the HTTP request headers in the SyncML binding.

Request Header	Client Requirements	Server Requirements
Accept	MUST	MUST
Accept-Charset	MUST	MUST
Accept-Encoding	MAY	MAY
Accept-Language	MAY	MAY
Authorization	MAY	MAY
Expect	MAY	MAY
From	MAY	MAY
Host	MAY	MAY
If-Match	MAY	MAY
If-Modified-Since	MAY	MAY
If-None-Match	MAY	MAY
If-Range	MAY	MAY
If-Unmodified-Since	MAY	MAY
Max-Forwards	MAY	MAY
Proxy-Authorization	MAY	MAY
Range	MAY	MAY
Referer	MAY	MAY

TE	MAY	MAY
User-Agent	MUST	MUST

The Accept request header is used to specify which media types are acceptable in the response.

Data synchronization client implementations conforming to this specification MUST support this header with either the "application/vnd.syncml+xml" or "application/vnd.syncml+wbxml" media type values. Data synchronization server implementations conforming to this specification MUST support both "application/vnd.syncml+xml" and "application/vnd.syncml+wbxml" media type values, as requested by the SyncML data synchronization client.

Device Management client implementations conforming to this specification MUST support this header with either the "application/vnd.syncml.dm+xml" or "application/vnd.syncml.dm+wbxml" media type values. Device management server implementations conforming to this specification MUST support both "application/vnd.syncml.dm+xml" and "application/vnd.syncml.dm+wbxml" media type values, as requested by the SyncML device management client.

The following is an example of how this header is specified to indicate that the client expects responses formatted according to the clear-text, XML [XML] representation of SyncML data synchronization:

```
Accept: application/vnd.syncml+xml
```

The following is an example of how this header is specified to indicate that the client expects responses formatted according to the binary, WBXML [WBXML] representation of SyncML device management

```
Accept: application/vnd.syncml.dm+wbxml
```

The Accept-Charset request header is used to specify which character sets are acceptable in the response. Server implementations conforming to this specification MUST support this header with the "UTF-8" character set value. Client implementations SHOULD support the "UTF-8" character set. Implementations MAY support additional, IANA registered character set values. Client implementations not supporting UTF-8 SHOULD take careful consideration of the potential impact of lack of UTF-8 support on interoperability of the device. If a recipient is unable to provide support for the character set encoding specified in the Accept-Charset request headers sent by the originator, the recipient MUST send to the originator a HTTP status 406, "Not acceptable". This is in keeping with [RFC2616]. Note that there will be no SyncML message sent with this response. The following is an example of how this header is specified to indicate that the client expects responses formatted into the UTF-8 character set:

```
Accept-Charset: UTF-8
```

The Authorization request header is used by an HTTP client to authenticate itself to the HTTP server. Implementations conforming to this specification MAY support this header with the authorization values for "Basic" and "Digest Access Authentication" authentication schemes, as specified in [RFC2617]. The following is an example of how this header is specified to allow the HTTP client to authenticate itself with a Base64 character encoding of a userid of Aladdin and password of open sesame.

```
Authorization: Basic QWxhZGRpbjpvcGVuIHNlc2FtZQ==
```

The Accept-Encoding request header is similar to Accept, but restricts the content-codings (Section 3.5 of [RFC2616]) that are acceptable in the response. Implementations conforming to this specification MAY support this header. Note that since SyncML messages are frequently used in bandwidth constrained environments, the use of compression may be especially desirable. The following is an example of how this header is specified to allow the HTTP client to request particular compression types.

```
Accept-Encoding: gzip,deflate
```

The Proxy-Authorization request header is similar to the Authorization header except that it is specified by the HTTP client and used only by the next proxy in the connection chain. Implementations conforming to this specification MAY support this header and with the authorization values for "Basic" and "Digest Access Authentication" authentication schemes, as specified in [RFC2617]. The following is an example of how this header is specified to allow the HTTP client to authenticate itself with a userid of Aladdin and password of open sesame.

```
Proxy-Authorization: Basic QWxhZGRpbjpwGVuIHhlc2FtZQ==
```

The User-Agent request header identifies the type of user agent originating the request. This information is useful for the HTTP server to provide automated recognition of user agents for the sake of tailoring responses to avoid particular limitations or to take advantage of special features in the HTTP client. Implementations conforming to this specification MUST support this header and provide it in all HTTP requests. The following is an example of the usage of this header.

```
User-Agent: Foo Bar Sync Products v3.4
```

The other request headers MAY be supported by implementations conforming to this specification.

### 5.3.4 Response Headers

The following table summarizes the support for the HTTP response headers in the SyncML binding.

Method	Client Requirements	Server Requirements
Accept-Ranges	MAY	MAY
Age	MAY	MAY
Allow	MAY	MAY
Authentication-Info	MAY	MAY
Etag	MAY	MAY
Location	MAY	MAY
Proxy-Authenticate	MAY	MAY
Retry-After	MAY	MAY
Server	MAY	MAY
Vary	MAY	MAY
WWW-Authenticate	MAY	MAY

The Authentication-Info response header is defined by [RFC2617]. The header is used by an HTTP proxy or server to provide information back to the HTTP client about a successful HTTP client authentication. Implementations conforming to this specification MAY support this header with the Authentication-Information directives "nextnonce" and "rspauth". The former directive is used to specify the nonce to be used by the client for a future authentication. The nonce value SHOULD be a Base64 formatted string. The nextnonce value string MUST be 64 octets or less in length. The latter directive is used by the HTTP proxy or server to authenticate itself to the HTTP client. The following example shows how an HTTP server might use this response header to provide authentication credentials to an HTTP client that has successfully authenticated itself with the HTTP server.

```
Authentication-Info: nextnonce="Bruce"
rspauth="edd30630e82fabdc1e895d1d3a4c0450"
```

The Proxy-Authenticate response header is used by an HTTP proxy to challenge the authority of the HTTP client issuing it an HTTP request. Implementations conforming to this specification MAY support this header with the challenge values for "Basic" and "Digest Access Authentication" authentication schemes and the "Realm", "Domain", "Nonce", "Stale" and "Algorithm" authentication parameters, as specified in [RFC2617]. The nonce value SHOULD be a Base64 formatted string. The "MD5" algorithm MAY be supported by implementations that conform to this specification. Other algorithms can also be supported. The following is an example of this header being used by an HTTP proxy to challenge a HTTP client with the Digest authentication scheme for the http://www.syncml.host.com realm.

```
Proxy-Authenticate: Digest
Domain="http://www.datasync.org/servlet/syncit"
```

The WWW-Authenticate response header is used by the HTTP server to challenge the authority of the HTTP client issuing it an HTTP request. Implementations conforming to this specification MAY support this header with the challenge values for "Basic" and "Digest Access Authentication" authentication schemes and the "Realm", "Domain", "Nonce", "Stale" and "Algorithm" authentication parameters, as specified in [RFC2617]. The nonce value SHOULD be a Base64 formatted string.

The "MD5" algorithm MAY be supported by implementations that conform to this specification. Other algorithms can also be supported. The following is an example of this header being used by an HTTP server to challenge an HTTP client with the Basic authentication scheme for the WallyWorld@syncml.host.com realm.

```
WWW-Authenticate: Basic Realm="WallyWorld@syncml.host.com"
```

The other response headers MAY be supported by implementations conforming to this specification.

### 5.3.5 Pushing Data from the server to the client

Pushing data from a server to a client is defined according to [PUSH]. This functionality can be used to accomplish the Server Alert Notification as defined in the SyncML Server Alert Notification specification [SAN]. The model is as shown below.

The model is analogous to the push model described in [SYNCWSP] with the difference being that instead of the push services between the Push Proxy Gateway (PPG) and the device being defined by the OTA-WSP protocol they are defined by the OTA-HTTP protocol. Full details of the specifics of both of these are described in [PUSH].

When pushing SyncML data from the server to the client, the following rules MUST be adhered to as well as the order of the WSP headers:

- The Content-Type header MUST include the MIME media type, *application/vnd.syncml.notification* for Device Management usage for the Server Alert Notification package as defined in [SAN] and *application/vnd.syncml.ds.notification* for Data Synchronization usage. The appropriate Content-Type binary code MUST be used instead of its textual representation, that is, 0x44 for Device Management and 0x4E for Data Synchronization.
- The X-WAP-Application-ID header MUST include the application-id *x-wap-application:syncml.dm* for Device Management packages or *x-wap-application:push.syncml* for Data Synchronization packages. The appropriate application-id binary code MUST be used instead of the textual representation of the Application-id, that is, 0x05 for Data Synchronization and 0x07 for Device Management.

The Push Application architecture for (connectionless) OTA-WSP and OTA-HTTP is depicted below to illustrate the difference between Server Alert Notification over WSP and over HTTP:

Note that the push model is not limited to OTA usage, the model could also be used locally with, for example, a SyncML server running on a PC connected to a SyncML client via a cable. In this situation the server would be **REQUIRED** to emulate the PPG services. This mechanism might prove useful to vendors who require a means of achieving local Server Alerted Notification over TCP.

## 5.4 Security

HTTP client and HTTP server authentication is based on the mechanism defined in [RFC2617]. Implementations conforming to this implementation **MUST** support this mechanism for "Basic" and "Digest Access Authentication". The Base64 character encoded "Basic" and "MD5" algorithm of the "Digest Access Authentication" authentication schemes **MAY** be supported. The HTTP headers and parameters that **MUST** be supported are described in the previous sections for request and response headers.

The Content-MD5 header field can be used to provide a message integrity check of the SyncML Message in the body. Use of this header is a good idea for detecting accidental modification of the entity-body in transit, but is not proof against malicious attack.

HTTP proxy and HTTP server implementations conforming to this specification **MAY** support both the ability to challenge unauthenticated requests and also accept authentication request headers in a request; which will not require subsequent challenge responses unless some part of the credential is incorrect. The latter requirement is **REQUIRED** to address the need for minimal request/response traffic for mobile networks.

The authentication mechanisms defined by [RFC2617] address protecting the authentication credentials. However, the remainder of the HTTP request and response messages are available to the eavesdropper. For more robust security for the HTTP connection, SSL [SSL], TLS [RFC4346], HTTPS, or some form of upgrading to TLS over HTTP [RFC2817] [RFC2818] **SHOULD** be used. These mechanisms are not mandated for implementations conforming to this specification.

## 6. Examples

The XML [XML] in these examples are generally formatted one element type per line for readability purposes, but need not be formatted as such in actual usage.

The following is a more complex example of an HTTP request with an actual clear-text, XML SyncML message in the body.

```

POST ./servlet/syncit HTTP/1.1

Host: http://www.syncml.host.com
Accept: application/vnd.syncml+xml
Accept-Charset: utf-8
Accept-Encoding: chunked
Accept-Language: en-US
Authorization: Basic QWxhZGRpbjpvGVuIHhNlc2FtZQ==
Content-Type: application/vnd.syncml+xml; charset="utf-8"
User-Agent: Foo Bar Sync Products v3.4
Cache-Control: no-store
Transfer-Encoding: chunked

The following is an example of a Server Alerted Notification message for Data Synchronization delivered using OTA-HTTP.

```

POST /wappush HTTP/1.1

Host:
Date: Fri, 19 Apr 2002 15:00:05 BST
Content-Type: application/http
Content-Length: 500
X-Wap-Push-OTA-Version: 1.0
HTTP/1.1 200 OK
Date: Fri, 19 Apr 2002 15:00:00 BST
Last-Modified: Date: Fri, 19 Apr 2002 15:00:00 BST
Content-Language: en
Content-Length: 300
Content-Type: application/vnd.syncml.ds.notification
X-Wap-Application-Id: x-wap-application:push.syncml

... insert appropriate message content here ...

```

## Appendix A. Change History

(Informative)

### A.1 Approved Version History

Reference	Date	Description
OMA-SyncML-HTTPBinding-V1_2-20030612-A	12 Jun 2003	Initial OMA release
OMA-SyncML-HTTPBinding-V1_2-20070221-A	21 Feb 2007	Status changed to Approved by TP: OMA-TP-2007-0005R03-INP_ERP_SyncML_Common_V1_2_for_Final_Approval
OMA-SyncML-HTTPBinding-V1_2_1	13 Aug 2007	Updated with agreed Class 3 CRs: OMA-DS-2006-0063 OMA-DS-2006-0123R-01 OMA-DS-DS_1_2-2007-0022

## Appendix B. Static Conformance Requirements (Normative)

The notation used in this appendix is specified in [IOPPROC].

### B.1 Client Features

#### B.1.1 Client HTTP Requirements

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-C-001	Support for HTTP Client	4	O	DSDM-HTTP-C-005 AND DSDM-HTTP-C-010 AND DSDM-HTTP-C-015 AND DSDM-HTTP-C-019 AND DSDM-HTTP-C-020 AND DSDM-HTTP-C-037

#### B.1.2 Client HTTP Method Requirements

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-C-002	Support for OPTIONS Method	5.3.1	O	
DSDM-HTTP-C-003	Support for GET Method	5.3.1	O	
DSDM-HTTP-C-004	Support for HEAD Method	5.3.1	O	
DSDM-HTTP-C-005	Support for POST Method	5.3.1	O	
DSDM-HTTP-C-006	Support for PUT Method	5.3.1	O	
DSDM-HTTP-C-007	Support for DELETE Method	5.3.1	O	
DSDM-HTTP-C-008	Support for TRACE Method	5.3.1	O	
DSDM-HTTP-C-009	Support for CONNECT Method	5.3.1	O	

#### B.1.3 Client HTTP General Header Requirements

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-C-010	Support for Cache-Control General Header	5.3.2	O	
DSDM-HTTP-C-011	Support for Connection General Header	5.3.2	O	
DSDM-HTTP-C-049	Support for Content-Encoding Header	5.3.2	O	
DSDM-HTTP-C-012	Support for Date General Header	5.3.2	O	
DSDM-HTTP-C-013	Support for Pragma General Header	5.3.2	O	
DSDM-HTTP-C-014	Support for Trailer General Header	5.3.2	O	
DSDM-HTTP-C-015	Support for Transfer-Encoding General Header	5.3.2	O	
DSDM-HTTP-C-016	Support for Upgrade General Header	5.3.2	O	
DSDM-HTTP-C-017	Support for Via General Header	5.3.2	O	
DSDM-HTTP-C-018	Support for Warning General Header	5.3.2	O	

#### B.1.4 Client HTTP Request Header Requirements

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-C-019	Support for Accept Request Header	5.3.3	O	

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-C-020	Support for Accept-Charset Request Header	5.3.3	O	
DSDM-HTTP-C-021	Support for Accept-Encoding Request Header	5.3.3	O	
DSDM-HTTP-C-022	Support for Accept-Language Request Header	5.3.3	O	
DSDM-HTTP-C-023	Support for Authorization Request Header	5.3.3	O	
DSDM-HTTP-C-024	Support for Expect Request Header	5.3.3	O	
DSDM-HTTP-C-025	Support for From Request Header	5.3.3	O	
DSDM-HTTP-C-026	Support for Host Request Header	5.3.3	O	
DSDM-HTTP-C-027	Support for If-Match Request Header	5.3.3	O	
DSDM-HTTP-C-028	Support for If-Modified-Since Request Header	5.3.3	O	
DSDM-HTTP-C-029	Support for If-None-Match Request Header	5.3.3	O	
DSDM-HTTP-C-030	Support for If-Range Request Header	5.3.3	O	
DSDM-HTTP-C-031	Support for If-Unmodified-Since Request Header	5.3.3	O	
DSDM-HTTP-C-032	Support for Max-Forwards Request Header	5.3.3	O	
DSDM-HTTP-C-033	Support for Proxy-Authorization Request Header	5.3.3	O	
DSDM-HTTP-C-034	Support for Range Request Header	5.3.3	O	
DSDM-HTTP-C-035	Support for Referer Request Header	5.3.3	O	
DSDM-HTTP-C-036	Support for TE Request Header	5.3.3	O	
DSDM-HTTP-C-037	Support for User-Agent Request Header	5.3.3	O	

### B.1.5 Client HTTP Response Header Requirements

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-C-038	Support for Accept-Ranges Response Header	5.3.4	O	
DSDM-HTTP-C-039	Support for Age Response Header	5.3.4	O	
DSDM-HTTP-C-040	Support for Allow Response Header	5.3.4	O	
DSDM-HTTP-C-041	Support for Authentication-Info Response Header	5.3.4	O	
DSDM-HTTP-C-042	Support for Etag Response Header	5.3.4	O	
DSDM-HTTP-C-043	Support for Location Response Header	5.3.4	O	
DSDM-HTTP-C-044	Support for Proxy-Authenticate Response Header	5.3.4	O	
DSDM-HTTP-C-045	Support for Retry-After Response Header	5.3.4	O	
DSDM-HTTP-C-046	Support for Server Response Header	5.3.4	O	
DSDM-HTTP-C-047	Support for Vary Response Header	5.3.4	O	
DSDM-HTTP-C-048	Support for WWW-Authenticate Response Header	5.3.4	O	

## B.2 Server Features

### B.2.1 Server HTTP Requirements

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-S-001	Support for HTTP Server	4	O	DSDM-HTTP-S-005 AND DSDM-HTTP-S-010 AND DSDM-HTTP-S-015 AND DSDM-HTTP-S-019 AND DSDM-HTTP-S-020 AND DSDM-HTTP-S-037

### B.2.2 Server HTTP Method Requirements

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-S-002	Support for OPTIONS Method	5.3.1	O	
DSDM-HTTP-S-003	Support for GET Method	5.3.1	O	
DSDM-HTTP-S-004	Support for HEAD Method	5.3.1	O	
DSDM-HTTP-S-005	Support for POST Method	5.3.1	O	
DSDM-HTTP-S-006	Support for PUT Method	5.3.1	O	
DSDM-HTTP-S-007	Support for DELETE Method	5.3.1	O	
DSDM-HTTP-S-008	Support for TRACE Method	5.3.1	O	
DSDM-HTTP-S-009	Support for CONNECT Method	5.3.1	O	

### B.2.3 Server HTTP General Header Requirements

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-S-010	Support for Cache-Control General Header	5.3.2	O	
DSDM-HTTP-S-011	Support for Connection General Header	5.3.2	O	
DSDM-HTTP-S-049	Support for Content-Encoding Header	5.3.2	O	
DSDM-HTTP-S-012	Support for Date General Header	5.3.2	O	
DSDM-HTTP-S-013	Support for Pragma General Header	5.3.2	O	
DSDM-HTTP-S-014	Support for Trailer General Header	5.3.2	O	
DSDM-HTTP-S-015	Support for Transfer-Encoding General Header	5.3.2	O	
DSDM-HTTP-S-016	Support for Upgrade General Header	5.3.2	O	
DSDM-HTTP-S-017	Support for Via General Header	5.3.2	O	
DSDM-HTTP-S-018	Support for Warning General Header	5.3.2	O	

### B.2.4 Server HTTP Request Header Requirements

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-S-019	Support for Accept Request Header	5.3.3	O	
DSDM-HTTP-S-020	Support for Accept-Charset Request Header	5.3.3	O	

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-S-021	Support for Accept-Encoding Request Header	5.3.3	O	
DSDM-HTTP-S-022	Support for Accept-Language Request Header	5.3.3	O	
DSDM-HTTP-S-023	Support for Authorization Request Header	5.3.3	O	
DSDM-HTTP-S-024	Support for Expect Request Header	5.3.3	O	
DSDM-HTTP-S-025	Support for From Request Header	5.3.3	O	
DSDM-HTTP-S-026	Support for Host Request Header	5.3.3	O	
DSDM-HTTP-S-027	Support for If-Match Request Header	5.3.3	O	
DSDM-HTTP-S-028	Support for If-Modified-Since Request Header	5.3.3	O	
DSDM-HTTP-S-029	Support for If-None-Match Request Header	5.3.3	O	
DSDM-HTTP-S-030	Support for If-Range Request Header	5.3.3	O	
DSDM-HTTP-S-031	Support for If-Unmodified-Since Request Header	5.3.3	O	
DSDM-HTTP-S-032	Support for Max-Forwards Request Header	5.3.3	O	
DSDM-HTTP-S-033	Support for Proxy-Authorization Request Header	5.3.3	O	
DSDM-HTTP-S-034	Support for Range Request Header	5.3.3	O	
DSDM-HTTP-S-035	Support for Referer Request Header	5.3.3	O	
DSDM-HTTP-S-036	Support for TE Request Header	5.3.3	O	
DSDM-HTTP-S-037	Support for User-Agent Request Header	5.3.3	O	

## B.2.5 Server HTTP Response Header Requirements

Item	Function	Ref.	Status	Requirement
DSDM-HTTP-S-038	Support for Accept-Ranges Response Header	5.3.4	O	
DSDM-HTTP-S-039	Support for Age Response Header	5.3.4	O	
DSDM-HTTP-S-040	Support for Allow Response Header	5.3.4	O	
DSDM-HTTP-S-041	Support for Authentication-Info Response Header	5.3.4	O	
DSDM-HTTP-S-042	Support for Etag Response Header	5.3.4	O	
DSDM-HTTP-S-043	Support for Location Response Header	5.3.4	O	
DSDM-HTTP-S-044	Support for Proxy-Authenticate Response Header	5.3.4	O	
DSDM-HTTP-S-045	Support for Retry-After Response Header	5.3.4	O	
DSDM-HTTP-S-046	Support for Server Response Header	5.3.4	O	
DSDM-HTTP-S-047	Support for Vary Response Header	5.3.4	O	
DSDM-HTTP-S-048	Support for WWW-Authenticate Response Header	5.3.4	O
