1. Scope (Informative)

This document contains use cases and requirements for Device Management 1.3. It describes a set of enhanced or new functional requirements for the management of a Device. These functional requirements will maintain the backward compatibility with DM 1.2.
2. References

2.1 Normative References

2.2 Informative References

3. Terminology and Conventions

3.1 Conventions

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

All sections and appendixes, except “Scope” and “Introduction”, are normative, unless they are explicitly indicated to be informative.

4. Introduction (Informative)

Currently, DM technology allows a device to present the information stored on the device to an external server, in case the external server has sufficient rights to do this. This can be seen in the following picture:

![Figure 1: Device management](image)

At the left side of the picture we can find the device, with its internal resources. The device presents part of this information to the server that is on the right part. The way to do this is through Management Objects at the DM Tree.

Along with the emergence of advanced Devices and new services, the device management framework already defined in DM 1.2 [DM_PRO_1.2] may need to be enhanced to address more market needs. The objective of this document is to collect corresponding use cases to develop a set of enhanced or new functional requirements for the management of a Device.
5. Device Management release description (Informative)

The Device Management (DM) Enabler provides a platform neutral protocol to allow servers to remotely manage devices. DM is intended to operate over a variety of transport and notification protocols in a platform neutral format.

5.1 Version 1.2

The DM V1.2 Enabler added or improved the following functionality:

• Enhanced security
• DM Profile bootstrap
• TNDS
• Inbox
• DM Account
• XML Encryption
• Generic Alert
• Connectivity settings moved to ConnMO Reference Release
• Nonce Resynchronization

5.2 Version 1.3

The DM V1.3 Enabler supports the following additional functionality.

• Support for SIP/UDP transport bindings
• Specify for mandatory support for bootstrap/TNDS
• Support for rich information in notification message including expiration, reason for session, etc.
• Support for the discovery of optional DM features supported by the DM Client.
6. Requirements (Normative)

6.1 Modularisation

The requirements for DM 1.3 are in addition to the requirements for DM 1.2 [DM12RD].

This section depicts the whole release as a collection of different functional modules where each one is a group of requirements identified as related with the offering of functionality. Functional modules will be described as mandatory functionality (core functionality) or optional functionality (value-added functionality).

The defined functional modules are as follows:

- **Bootstrap**: this functional module supports the process of installing parameters and/or applications on a DM Client to establish a given service for the first time, or for the purposes of resetting a DM Client to initial settings. This is a mandatory functional module.

- **Notification**: this functional module provides for out-of-band notification from a DM Server to a DM Client, indicating that a session is desired. This is a mandatory functional module.

- **Authentication**: this functional module provides secure management sessions between a DM Server and a DM Client. This is a mandatory functional module.

- **Transports**: this functional module supports multiple transports for communication between a DM Server and a DM Client. This is a mandatory functional module.

- **General**: Some requirements are intended to affect all the functional modules, and therefore are marked in the functional module column of the requirement’s table as “General”.

6.2 High-Level Functional Requirements

<td>The DM enabler notification SHALL provide expiration for the notification message.</td>
<td>1.3</td>
<td>Notification</td>
</tr>
<tr>
<td></td>
<td><strong>Informational Note</strong>: DM 1.2 notification does not provide for expiration, reason for session or recommended protocol version. The new notification MUST be backward compatible with the DM 1.2 version.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
DM-HLF-007 The DM enabler notification SHALL convey reason for session information in the notification message.  
**Informational Note:** DM 1.2 notification does not provide for expiration, reason for session or recommended protocol version. The new notification MUST be backward compatible with the DM 1.2 version.

DM-HLF-008 The reason for session information SHALL be made available to the end user as additional information before establishing the management session if user interaction is required.

DM-HLF-009 The DM enabler SHALL provide a mechanism for the discovery of optional DM features supported by the client.  
**Informational Note:** DM 1.2 already provides an indication of Large Object delivery. Optional features to be indicated are Large Object, Nonce Synchronization, TNDS, Inbox object, User Interaction Commands, asynchronous data via Client initiated Alert, Generic Alert, Correlator, Client Event Alert.

DM-HLF-010 The DM enabler SHALL specify mandatory TNDS support.  
**Informational Note:** DM 1.2 already supports optional support for TNDS.

DM-HLF-011 The DM account information SHOULD include highest protocol version supported by the server.  
**Informational Note:** DM 1.2 account does not provide highest protocol version. The new account information MUST be backward compatible with DM 1.2

DM-HLF-012 The DM Enabler SHALL provide a mechanism to obtain the list of locations of all occurrences of an MO within the Device tree, given the MO Identifier.

DM-HLF-013 The DM enabler SHOULD provide a mechanism that allows a DM Client to read bootstrap data larger than 32KB from a smartcard

DM-HLF-014 The DM enabler notification SHOULD indicate which transport binding and authentication type are required by the DM Server in the succedent DM session.

DM-HLF-015 The DM enabler notification SHOULD indicate if some specific information in the DevDetail is desired by the DM server.

DM-HLF-016 The DM enabler SHALL specify HTTP Push notification method.  
**Informational Note:** DM 1.2 already supports the WAP PUSH method.

Table 1: High-Level Functional Requirements

<th>Description</th>
<th>Release</th>
<th>Functional module</th>
</tr>
</thead>
</table>
| DM-SEC-001 | The DM enabler Network Initiated Bootstrapping SHOULD also support a NETWORKID based on a shared secret between device and network provider.  
**Informational Note:** DM 1.2 suggests IMSI/ESN as shared secret NETWORKID which is a vulnerability, but needs to be kept for backwards compatibility. | 1.3     | Bootstrap         |

Appendix B. Use Cases (Informative)

B.1 Bootstrap retrieval via URL

B.1.1 Short Description

A DM client will download, authenticate and process a bootstrap message from a URL. This downloaded bootstrap message would be processed just like a normal bootstrap message. The DM client would decide when to download the bootstrap message, and would be allowed to check to see if the bootstrap message had changed from the last download before processing it.

B.1.2 Market benefits

Device can directly retrieve a bootstrap message from a server without having to wait for the server to discover the device. Devices can retrieve the bootstrap on networks without notification.

B.2 Reason for session

B.2.1 Short Description

A Network Operator changes its platform configuration for its browsing service and initiates a campaign to update the browser settings on devices already in the field. The Device Management Server sends the DM Notification via SMS to the users’ devices. The DM Notification is the trigger to perform a DM session but local market policies oblige the Network Operator to provide the user with a legal disclaimer concerning benefits and risks of such session before performing it. For this reason, an informative text is associated to the DM Notification. The DM Client in the users’ device receives the DM Notification and displays the informative text in a popup informing, for example, that Network Operators’ DM System requests a new session in order to update the browser settings. This text also indicates that if user decides to refuse the connection, he/she won’t be able to use the browser, and that Network Operators’ DM System is not responsible for any damage suffered by device in consequence of the DM session. Finally, the user confirmation is requested for starting or refusing the connection with the DM Server. If the user accepts, the client initiates the DM session and he/she can use the browser with the new settings.

B.2.2 Market benefits

The Network Operator can inform the user about the reason and legal notice of the request for a DM session using the DM Notification, avoiding the need, for example, of a text SMS sent previously and separately and increasing the users’ acceptance for remote configurations.

The user can be informed about the reasons why the DM Session is needed avoiding unnecessary impact on the services he/she consumes regularly (e.g. browser).

B.3 Search for MO instances by MO Identifier

B.3.1 Short Description

A Device may support several kinds of MOs. These MOs may exist during factory bootstrap or may be dynamically created by the DM Server. The DM Server needs to know the location of the MO or its properties since it is Device dependent. Currently structural queries on the management tree to obtain DDF files are used to identify the location of a MO. However DDF files may be static, not provided or out-of-date which cause structural queries insufficient for this purpose. When multiple DM Servers exist, this functionality would also need a convenient way to find MO instances or their properties.
B.3.2 Market Benefits

Adding the ability to dynamically retrieve the location of a specific MO in the tree will simplify the design and implementation of application within the DM Server – instead of hard-coding the location of the MO per specific devices (by make, model, version, etc.), the application only needs to know the MO ID.
