

Folder data object specification

Approved Version 1.2.2 – 19 Mar 2009

Open Mobile Alliance
OMA-TS-DS_DataObjFolder-V1_2_2-20090319-A

Use of this document is subject to all of the terms and conditions of the Use Agreement located at <http://www.openmobilealliance.org/UseAgreement.html>.

Unless this document is clearly designated as an approved specification, this document is a work in process, is not an approved Open Mobile Alliance™ specification, and is subject to revision or removal without notice.

You may use this document or any part of the document for internal or educational purposes only, provided you do not modify, edit or take out of context the information in this document in any manner. Information contained in this document may be used, at your sole risk, for any purposes. You may not use this document in any other manner without the prior written permission of the Open Mobile Alliance. The Open Mobile Alliance authorizes you to copy this document, provided that you retain all copyright and other proprietary notices contained in the original materials on any copies of the materials and that you comply strictly with these terms. This copyright permission does not constitute an endorsement of the products or services. The Open Mobile Alliance assumes no responsibility for errors or omissions in this document.

Each Open Mobile Alliance member has agreed to use reasonable endeavors to inform the Open Mobile Alliance in a timely manner of Essential IPR as it becomes aware that the Essential IPR is related to the prepared or published specification. However, the members do not have an obligation to conduct IPR searches. The declared Essential IPR is publicly available to members and non-members of the Open Mobile Alliance and may be found on the “OMA IPR Declarations” list at <http://www.openmobilealliance.org/ipr.html>. The Open Mobile Alliance has not conducted an independent IPR review of this document and the information contained herein, and makes no representations or warranties regarding third party IPR, including without limitation patents, copyrights or trade secret rights. This document may contain inventions for which you must obtain licenses from third parties before making, using or selling the inventions. Defined terms above are set forth in the schedule to the Open Mobile Alliance Application Form.

NO REPRESENTATIONS OR WARRANTIES (WHETHER EXPRESS OR IMPLIED) ARE MADE BY THE OPEN MOBILE ALLIANCE OR ANY OPEN MOBILE ALLIANCE MEMBER OR ITS AFFILIATES REGARDING ANY OF THE IPR'S REPRESENTED ON THE “OMA IPR DECLARATIONS” LIST, INCLUDING, BUT NOT LIMITED TO THE ACCURACY, COMPLETENESS, VALIDITY OR RELEVANCE OF THE INFORMATION OR WHETHER OR NOT SUCH RIGHTS ARE ESSENTIAL OR NON-ESSENTIAL.

THE OPEN MOBILE ALLIANCE IS NOT LIABLE FOR AND HEREBY DISCLAIMS ANY DIRECT, INDIRECT, PUNITIVE, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES ARISING OUT OF OR IN CONNECTION WITH THE USE OF DOCUMENTS AND THE INFORMATION CONTAINED IN THE DOCUMENTS.

1. Scope

The **folder** data object is presented in this document. The content-specific aspects of synchronization (filtering keywords, etc...) are listed and clarified.

2.2 Informative References

none

3. Terminology and Conventions

3.1 Conventions

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

All sections and appendixes, except “Scope” and “Introduction”, are normative, unless they are explicitly indicated to be informative.

3.2 Definitions

Data type The schema used to represent a data object (e.g., text/calendar MIME content type for an iCalendar representation of calendar information or text/directory MIME content type for a vCard representation of contact information).

3.3 Abbreviations

OMA Open Mobile Alliance

4. Introduction

The folder data objects can be used to organize objects such as email, file, other folder objects, etc. in a hierarchical manner.

5. XML Usage

The **folder** objects are represented in a mark-up language defined by [XML]. The **folder** is an XML application. The **folder** DTD (Document Type Definition) defines the XML document type used to represent a **folder** object. The **folder** DTD can be found in Section 8.7, but it is not necessary to read the DTD in order to understand it.

Folder objects are specified using well-formed XML. However, the **folder** need not be valid XML. That is, the **folder** objects do not need to specify the XML declaration or prolog. They only need to specify the body of the XML document. This restriction allows for the **folder** objects to be specified with greater terseness than well-formed, valid XML documents.

5.1 Including folder object in other XML documents

When using the **folder** object as content of another XML document element the mark-up characters MUST be properly escaped or the CDATA sections MUST be used. See [XML] specification for details on character escaping and usage of CDATA sections. See section 10.3 of this document for an example.

5.2 XML Namespaces

Folder objects to date have no elements that may include elements of the other namespaces.

5.3 XML Attributes

In order to simplify the implementation of the **folder** objects in small devices, the **folder** objects have been intentionally designed to use the XML elements only. Currently no XML attributes are being defined for **folder** objects.

5.4 WBXML

XML can be viewed as more verbose than alternative binary representations. This is often cited as a reason why it may not be appropriate for low bandwidth network protocols. In most cases, **folder** uses shortened element type. This provides a minor reduction in verbosity.

Additionally, the **folder** objects can be encoded in a tokenized, binary format defined by [WBXML]. The use of [WBXML] format is external to specification of the **folder** and should be transparent to any application. The combination of the use of shortened element type names and an alternative binary format makes **folder** object competitive, from a compressed format perspective, with alternative, but private, binary representations.

6. MIME Usage

The [RFC2045] Internet standard provides an industry-accepted mechanism for identifying different content types. The **folder** object is identified by a MIME media type. The `application/vnd.omads-folder+xml` MIME content type MUST be used to indicate the XML **folder** object wherever such indication is required. The `application/vnd.omads-folder+wbxml` MIME content type MUST be used to indicate the WBXML **folder** object wherever such indication is required.

7. Data types

The following basic data type definitions are provided for referencing from other parts of this document.

7.1 datetime

Usage: This value type is used to identify values that specify a precise calendar date and time of day.

Description:

The *datetime* data type is used to identify values that contain a precise calendar date and time of day. The format is based on the [ISO 8601] complete representation, basic format for a calendar date and time of day. The text format is a concatenation of the "date", followed by the LATIN CAPITAL LETTER T character (US-ASCII decimal 84) time designator, followed by the "time" format.

The *datetime* data type expresses time values in two forms:

The form of date and time with UTC offset **MUST NOT** be used. For example, the following is not valid for a date-time value:

```
...  
<datefield>19980119T230000-0800</datefield> <!-- Invalid time format -->  
...
```

FORM #1: DATE WITH LOCAL TIME

The date with local time form is simply a date-time value that does not contain the UTC designator nor does it reference a time zone. For example, the following represents January 18, 1998, at 11 PM:

```
...  
<datefield>19980118T230000</datefield> <!-- January 18, 1998, 11 PM -->  
...
```

This notation of *datetime* type is to be used by devices that have no knowledge of the time zone in which they operate. In this case, the *datetime* value that is being transferred is usually the same as the value that is being stored and shown to the user in the application UI.

FORM #2: DATE WITH UTC TIME

The date with UTC time, or absolute time, is identified by a LATIN CAPITAL LETTER Z suffix character (US-ASCII decimal 90), the UTC designator, appended to the time value. For example, the following represents January 19, 1998, at 0700 UTC:

```
...  
<datefield>19980119T070000Z</datefield> <!-- January 19,1998,07:00 UTC -->  
...
```

7.2 bool

Usage: To be used for Boolean type fields

Restrictions: A text value that MUST be either “true” to indicate Boolean “true” or “false” to indicate “false”. If the field is not present its value is assumed to be “false”.

Example:

```
...
<booleanfield>true</booleanfield> <!-- the field is set to "true" -->
...
```

7.3 text

Usage: To be used for textual fields

Restrictions: If the field is not present its value is assumed to be an empty string.

Example:

```
...
<textfield>Hello World!</textfield>
...
```

7.4 int

Usage: To be used for integer numeric fields.

Restrictions: The format for the integer values is defined here in an ABNF notation [RFC2234].

```
nonzero-digit = "1" / "2" / "3" / "4" / "5" / "6" / "7" / "8" / "9"

octal-digit = "0" / "1" / "2" / "3" / "4" / "5" / "6" / "7"

hexadecimal-digit = "0" / "1" / "2" / "3" / "4" / "5" / "6" / "7" / "8" / "9"
/
/ "a" / "b" / "c" / "d" / "e" / "f"
/
/ "A" / "B" / "C" / "D" / "E" / "F"

decimal-constant = nonzero-digit *("0" / nonzero-digit)
hexadecimal-constant = ("0x" / "0X") 1*hexadecimal-digit
octal-constant = "0" 1*octal-digit

integer-value = *1( "+" / "-" ) (decimal-constant / hexadecimal-constant
/ octal-constant)
```

Example:

```
...
<negativevalue>-1234</negativevalue>
<positivevalue>1234</positivevalue>
<anotherpositivevalue>+0xfffab5</anotherpositivevalue>
<octal>010</octal> <!-- octal value equivalent to decimal 8 -->
...
```

8. Mark-up Language Description

8.1 Folder

Usage: Indicates the beginning of the object

Parent elements: None

Content model:

```
Folder (name, created?, modified?, accessed?, attributes?, role?, Ext*)
```

8.2 name

Usage: Specifies name of the folder.

Parent elements: Folder

Restrictions: This element is mandatory and its value **MUST NOT** be an empty string. The name **SHOULD NOT** include any location information (URL, path, etc.).

Content model:

```
name (#PCDATA)
```

8.3 created

Usage: Specifies the date and time when the folder was created

Parent elements: Folder

Restrictions: *datetime* type field as specified in section 7.1.

Content model:

```
created (#PCDATA)
```

8.4 modified

Usage: Specifies the date and time when the folder object was last changed.

Parent elements: Folder

Restrictions: *datetime* type field as specified in section 7.1.

Content model:

```
modified (#PCDATA)
```

8.5 accessed

Usage: Specifies the date and time when folder object was last accessed.

Parent elements: Folder

Restrictions: *datetime* type field as specified in section 7.1.

Content model:

```
accessed (#PCDATA)
```

8.6 attributes

Usage: Specifies the state of the file system attributes of the folder.

Parent elements: Folder

Restrictions:

Content model:

```
attributes (h?, s?, a?, d?, w?, r?, x?)
```

8.6.1 h

Usage: Specifies “hidden” attribute state.

Parent elements: attributes

Restrictions: *bool* type field as specified in section 7.2.

Content model:

```
h (#PCDATA)
```

8.6.2 s

Usage: Specifies “system” attribute state.

Parent elements: attributes

Restrictions: *bool* type field as specified in section 7.2.

Content model:

```
s (#PCDATA)
```

8.6.3 a

Usage: Specifies “archived” attribute state.

Parent elements: attributes

Restrictions: *bool* type field as specified in section 7.2.

Content model:

a (#PCDATA)

8.6.4 d

Usage: Specifies “delete” attribute state. When the “delete” attribute is set, the folder can be deleted.

Parent elements: attributes

Restrictions: *bool* type field as specified in section 7.2.

Content model:

d (#PCDATA)

8.6.5 w

Usage: Specifies “writable” attribute state. If the “writable” attribute is set, it is possible to add or delete objects in the folder.

Parent elements: attributes

Restrictions: *bool* type field as specified in section 7.2.

Content model:

w (#PCDATA)

8.6.6 r

Usage: Specifies “readable” attribute state. If the “readable” attribute is set, it is possible to read the list of objects that are contained in the folder..

Parent elements: attributes

Restrictions: *bool* type field as specified in section 7.2.

Content model:

r (#PCDATA)

8.6.7 x

Usage: Specifies “executable” attribute state. If the “executable” attribute is set, it is possible to access to the objects that are contained in the folder..

Parent elements: attributes

Restrictions: *bool* type field as specified in section 7.2.

Content model:

x (#PCDATA)

8.7 role

Usage: Identifies the role of the folder within the store. Applications are expected to use this field when it is required to establish mapping between folders of different data stores (e.g. when two stores are being synchronized).

Parent elements: Folder

Restrictions: The following standard folder role identifiers can be used:

Table 1 Standard folder role identifiers

Role	Description
Message folder roles	
Inbox	The default folder for the delivered inbound messages
Outbox	The default folder for the messages that are pending the delivery
Drafts	The default folder in for the messages that are being edited by the user.
Sent	The default folder for delivered outbound messages.
File folder roles	
Documents	The default location for documents
Pictures	The default location for still pictures
Movies	The default location for movies
Music	The default location for music files
Applications	The default location of application files

In addition to standard identifiers, vendor-specific identifiers can be used. Refer to section 8.8.1 for guidelines on identifier naming.

8.8 Extension fields

8.8.1 Unique naming

If an extension field is required, the following naming convention **MUST** be followed in order to prevent undesirable field name collisions.

```
x-name = "x-" vendorid "-" 1*(ALPHA / DIGIT / "-") ;field name
vendorid = 3*(ALPHA / DIGIT) ;Vendor identification
ALPHA = %x41-5A / %x61-7A ; A-Z / a-z
DIGIT = %x30-39 ; 0-9
```

8.8.2 Ext

Usage: Specifies the non-standard, experimental extensions supported by the device. The extensions are specified in terms of the XML element type name and the value.

Parent Elements: Folder

Restrictions: The Ext element type **MUST** specify the extension element name. It may also specify one or more enumerated values. Multiple non-standard extensions can be specified by specifying the Ext element type multiple times. This element type is optional.

Content Model:

```
Ext (XNam, XVal*)
```

Attributes: None.

Example: The following example specifies a non-standard extension, named "CliVer" for a fictitious company, Foo, which takes values of "5.0", "5.01" or "5.02".

```
<Ext>
  <XNam>x-Foo-CliVer</XNam>
  <XVal>5.0</XVal>
  <XVal>5.01</XVal>
  <XVal>5.02</XVal>
</Ext>
```

8.8.3 XNam

Usage: Specifies the name of one of the extension element types.

Parent Elements: Ext

Restrictions: The element type is required whenever an Ext element is present.

Content Model:

```
XNam (#PCDATA)
```

Attributes: None.

Example:

```
<Ext>
  <XNam>x-Foo-CliVer</XNam>
  <XVal>5.0</XVal>
  <XVal>5.01</XVal>
  <XVal>5.02</XVal>
</Ext>
```

8.8.4 XVal

Usage: Specifies one of the valid values for an extension element type.

Parent Elements: Ext

Restrictions:

Content Model:

```
XVal (#PCDATA)
```

Attributes: None.

Example:

```
<Ext>
  <XNam>x-Foo-CliVer</XNam>
  <XVal>5.0</XVal>
  <XVal>5.01</XVal>
  <XVal>5.02</XVal>
</Ext>
```

9. DTD

```

10.SyncML Data Synchronization Usage

The following sections describe the content-specific recommendations for using the data synchronization [DSREPU] protocol with **folder** data objects.

10.1 CTCap

Refer to [DSDEVDTD] for further details on the specification of the Device Information DTD.

```
<CTCap>
  <CTType>application/vnd.omads-folder+xml</CTType>
  <Property>
    <PropName>name</PropName>
    <DataType>text</DataType>
    <MaxSize>260</MaxSize>
    <DisplayName>Folder name</DisplayName>
  </Property>
  <Property>
    <PropName>created</PropName>
    <DataType>datetime</DataType>
    <DisplayName>Date created</DisplayName>
  </Property>
</CTCap>
```

10.2 Data Sync Record and Field Level Filtering

10.2.1 Folder Media Object Filter

Filtering for folder objects can be specified using both `Record` and `Field` elements. The set of recommended keywords to support is as follows:

```
ct-filter-keyword = <Any field that is defined for the
                    application/vnd.omads-folder+xml content type
                    in this document>
```

10.3 Folder object replace example

```
...
<Sync>
  ...
  <Replace>
    <CmdID>6</CmdID>
    <Meta>
      <Type xmlns='syncml:metinf'>application/vnd.omads-folder+xml</Type>
    </Meta>
    <Item>
      <Source>
        <LocURI>123</LocURI>
      </Source>
      <SourceParent>
        <LocURI>345</LocURI>
      </SourceParent>
    </Item>
  </Replace>
</Sync>
```

```
</SourceParent>
...
<Data><![CDATA[
  <Folder>
    <name>OMAFiles</name>
    <created>20030807T231830</created>
  </Folder>]]>
</Data>
</Item>
</Replace>
</Sync>
...
```

11.A compact binary representation of Folder object

11.1 Public identifier

The following public identifier must be used:

`-//OMA//DTD DS-DataObjectFolder 1.2//EN`

The formal public identifier associated with this is 0x18.

11.2 Tag tokens

The following token codes represent tags in code page zero (0). All numbers are in hexadecimal.

Tag name	Token value (in a hexadecimal form)
Folder	05
name	06
created	07
modified	08
accessed	09
attributes	0A
h	0B
s	0C
a	0D
d	0E
w	0F
r	10
x	11
role	12
Ext	13
XNam	14
XVal	15

11.3 WBXML example

The following XML example shows a Sync command that includes an Add command containing a Folder Data Object. Note that the example is informative and some elements (for example, SyncHdr) are omitted.

```
...
<Sync>
  <CmdID>3</CmdID>
  <Target>
    <LocURI>./mail</LocURI>
  </Target>
  <Source>
    <LocURI>C:\email</LocURI>
  </Source>
  <NumberOfChanges>1</NumberOfChanges>
  <Add>
    <CmdID>4</CmdID>
    <Meta>
      <Type>application/vnd.omads-folder+wbxml</Type>
    </Meta>
    <Item>
      <Source>
        <LocURI>2</LocURI>
      </Source>
      <SourceParent>
        <LocURI>/</LocURI>
      </SourceParent>
      <Data><![CDATA[
        <Folder>
          <name>my folder</name>
          <created>20081030T174600Z</created>
          <role>inbox</role>
        </Folder>]]>
      </Data>
    </Item>
  </Add>
</Sync>
...
```

Here is the tokenized form (expanded and annotated form with numbers in hexadecimal). The example also assumes that the character encoding is UTF-8.

Token	Description
6A	<Sync>
4B	<CmdID>
C3	Opaque data follows
01	Length of opaque data
