1. **Scope**

   (Informative)

   This document defines the requirements for the Look and Feel Customization enabler, which allows the configuration and management of a device Look and Feel.
2. References

2.1. Normative References

2.2. Informative References

3. Terminology and Conventions

3.1. Conventions

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

All sections and appendixes, except “Scope” and “Introduction”, are normative, unless they are explicitly indicated to be informative.

3.2. Definitions

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Property associated with an LFC Element Setting or Package that is currently being used by the device as part of its Look and Feel</td>
</tr>
<tr>
<td>Authorized Principal</td>
<td>A Principal (see [OMADICT]) with permissions to perform specific action(s) and/or receive specific information</td>
</tr>
<tr>
<td>Default</td>
<td>Property associated with an LFC Element Setting or Package to be used by the device when no other Element Setting or Package is Active</td>
</tr>
<tr>
<td>LFC Content Server</td>
<td>An entity that supports the delivery of LFC Packages to an LFC enabled device</td>
</tr>
<tr>
<td>LFC Element</td>
<td>One characteristic of a device’s LFC (e.g. screen saver, incoming data message alert, ringtone per caller, etc).</td>
</tr>
<tr>
<td>LFC Element Setting</td>
<td>The combination of an LFC Element and an associated value for it</td>
</tr>
<tr>
<td>LFC Management Server</td>
<td>An entity that issues and handles the commands to perform Remote Management operations to an LFC enabled device</td>
</tr>
<tr>
<td>LFC Operation</td>
<td>An LFC operation is one of the following tasks: deliver, install, remove, update, query, activate and deactivate, permission setting, lock, unlock, inventory, and rollback</td>
</tr>
<tr>
<td>LFC Package</td>
<td>Group of LFC Element Settings that are part of the device’s Look and Feel. This package is used by a Service Provider to describe part or the whole Look and Feel Customization of the device</td>
</tr>
<tr>
<td>LFC Permission Setting</td>
<td>Is the act of assigning rights to an Authorized Principal to perform LFC Operations on LFC Element Settings and/or LFC Packages</td>
</tr>
<tr>
<td>LFC Server</td>
<td>Is an entity that supports LFC Operations in response to LFC Client's requests. Examples are LFC Management Server and LFC Content Server</td>
</tr>
<tr>
<td>Look and Feel</td>
<td>Appearance and behavior of the device’s user interface.</td>
</tr>
<tr>
<td>Look and Feel Branding</td>
<td>Look and Feel Customization performed by an actor (e.g. enterprise, network operator, manufacturer, service provider, etc) that results in the device being customized with the actor’s specific and proprietary Look and Feel</td>
</tr>
<tr>
<td>Look and Feel Customization</td>
<td>Process by which all or part of a device’s Look and Feel is modified.</td>
</tr>
<tr>
<td>Remote Management</td>
<td>LFC Operations originating from an entity residing on the network to be performed on an LFC capable device</td>
</tr>
<tr>
<td>Secure Removable Card</td>
<td>It refers to secure physical devices able to be inserted to and removed from terminal equipments. These devices must be able to protect not only logically but physically the data and/or applications they carry. Typical Secure Removable Card in the LFC is the UICC’s (see [OMADICT]).</td>
</tr>

</table>
4. Introduction (Informative)

The LFC enabler allows Customization of a device Look and Feel. The main objective of the enabler is to allow different entities in a mobile environment such as service providers, network operators, handset manufacturers, enterprises or device owners or device users, to configure the device Look and Feel according to their own requirements and what they are allowed (or have credentials/permissions) to customize. It is also an objective that the LFC enabler must be able to address Look and Feel Customization for all type of devices ranging from low-end, feature phones, smart-phones to communication devices.

![Figure 1: High Level diagram for LFC Enabler](image)

Note: An LFC user can have more than one LFC Service Provider

Elements that could be configured by using the Customization enabler may include (but are not limited to):

- Background, wallpaper and screensaver
- Ring tones, audio cues or sounds
- Start-up / Shutdown experience
- Animations and splash screens
- Status indicators
- Fonts
- Notification and error messages
- Keyboard: soft keys and navigation keys, and shortcuts
- Menus: menu items and arrangement
- Homepage and bookmarks

The customization process consists of LFC Operations. Applying customization information may be carried out using a variety of enablers defined by OMA (examples may be, but not limited to, OMA Download Over-the-Air or OMA Device Management). This enables customization of the device by providing a set of element settings that may be rendered on the device. It is envisaged that some of these elements may be common across all devices whilst other elements may be specific to a device. Existing solutions have been examined to identify new requirements necessary to fulfill the customization use cases.
Given the wide number of different implementations and solutions it is expected that any LFC data model will be implementation-specific and will likely vary for different vendors and different devices. That said, where there exists common agreement on collections of LFC Elements, it may be possible to specify a common data model for such collections. Such a common data model is not essential to the first release of the LFC enabler and should be informed by market experience and driven by interoperability considerations.

The LFC enabler consists of multiple models:

- The lightweight model consists of the basic operations Deliver and Install and the only Authorized Principal is the user. In the lightweight model, LFC content is pulled by the user. The lightweight model uses only the mandatory requirements.
- The network triggered model also consists of the basic operations Deliver and Install with the distinction that the Authorized Principal is a network entity. In the network triggered model, content is pushed from the network. The network triggered model uses only the mandatory requirements.

Note: The Network Triggered requirements have been finally removed from the LFC 1.0 specification

- The remote managed model also includes other operations in addition to the basic operations and the only Authorized Principle is a network entity. The requirements for the remote managed model are given by the combination of mandatory requirements and Remote Management requirements.

Table 1: LFC Models and Conformance

The LFC enabler will, where relevant and appropriate, re-use existing work in OMA. In this context, it should be possible to use existing OMA Device Management and provisioning enablers.

## 4.1 LFC Concepts

The LFC Enabler provides a framework by which Look and Feel Elements (e.g. screen saver, ringtones, etc.) of a device can be provided with data. This data is contained in an LFC Package which can then be acted upon by the device.

The following sections describe the LFC Package, the life-cycle these packages take on the device and some other actions that the LFC Enabler may support.

### 4.1.1 The LFC Package

The LFC Package is a set of one or more data items, normally related to a theme or brand, which are used to affect the appearance or sounds of the Look and Feel of a mobile device. The addressable items which affect the Look and Feel are known as LFC Elements and the data in the LFC Package which are associated to these LFC Elements are known as LFC Element Settings. The LFC Package also contains information which identifies the LFC Elements to which the data is associated and may provide operational instructions required for their installation or activation.
4.1.2 Life-Cycles of LFC Packages

The LFC Enabler handles LFP Packages through a sequence of stages that resemble a life-cycle. These stages will be described to provide a common understanding of the operations expected of the LFC Enabler.

- **LFC Package Delivery** – This is the stage where an LFC Package is transferred to an LFC-enabled client. The actual form of transfer utilized is not specific to LFC but LFC may need to specify some details supporting those transfer methods (e.g. declare an APPID to be used with OMA PUSH).

- **LFC Package Installation** – This stage is where the LFC Package is readied for use on the LFC Client. Any needed validation or authentication of the data would be performed during this stage.

- **LFC Package Activation** – This stage is where LFC Element Settings in an installed LFC Package are put into use. The activation may be done in the background or involve the user.

- **LFC Package Deactivation** – This stage is where the LFC Element Settings of an active LFC Package are taken out of use. The deactivation may be the result of loading a new LFC Package or directly, in which case the LFC Elements revert to default values. Following deactivation the LFC Package would remain on the device and could be available for another activation.

- **LFC Package Removal** – This stage is where an installed LFC Package is deleted and is no longer available for use. An attempt to remove an active LFC Package implies that it would be Deactivated and none of the LFC Elements would retain the values defined in the Package.

4.1.3 Additional Operational Activities

The LFC enabler may support additional operations depending on the service model available. These include the following:

- **Lock** – This is an operation which prohibits changes to the associated Active LFC Element Settings. When an LFC Element Setting or LFC Package is locked, the values of the associated LFC Element may not be changed by deactivation or update.

- **Unlock** – This is the reversal of the Lock operation and releases the LFC Element Setting or LFC Package permitting it to be changed

- **Update** – This is an operation which revises the data in an LFC Package on a device. This would not be permitted if any of the LFC Element Settings in the Package are locked. An update of an Active LFC Element Setting would cause the new data to be activated.

- **Query** – This is an operation by which an Authorized Principal can get information about the LFC Packages and LFC Element Settings available on the device. This includes installed and Active items as well as Default settings.

- **Inventory** – This is an operation by which an Authorized Principal can get a listing of all installed LFC Packages available on the device.

- **Rollback** – This is an operation by which an Authorized Principal can revert an LFC Element Setting to a previous value, values, or LFC Default value.
5 LFC release description

5.1 Version 1.0

The LFC V1.0 enabler supports the Lightweight Model and Remote Management Model. The Lightweight Model is mandatory and the Remote Management Model is optional. Both models support LFC Package operations. LFC Element Setting is not supported in the LFC V1.0 enabler.

This LFC V1.0 enabler provides the following main functionalities depending on the model applied:

- For the lightweight model which is the mandatory part of this enabler:
  - Delivery of LFC Packages from the LFC Content Server
  - Installation of the LFC Package on the device by LFC Client
  - Activation and deactivation of LFC Package
  - Removal of LFC Package

- For the Remote Management model which is optional in this release, the main functionalities in addition to those mentioned above are:
  - Query of LFC Packages
  - Update of LFC Packages
  - Activation and deactivation of LFC Packages
  - Locking and unlocking LFC Package
  - Query LFC Package
  - Marking default LFC Package
6. Requirements (Normative)

The following section details requirements for the LFC Enabler.

6.1 Modularisation

The LFC Enabler is defined before the modularisation concept introduced.

6.2 High-Level Functional Requirements

6.2.1 Mandatory Requirements

<table>

Appendix B. Use Cases

B.1 Look and Feel Management

B.1.1 Short Description

Mark is a big fan of a football team and is subscribed to a service offered by Custom Co. that periodically provides new LFC content related to the team.

After several months Mark’s subscription expires and according to the terms of the subscription agreement the LFC content must be deleted from the device.

B.1.1.1 Actors

- User
- Service Provider
- LFC Management Server
- LFC Client

B.1.1.2 Actor specific issues

- **User**: The user has his device customised with regularly updated content from his favourite team and when LFC content is deleted, he wants to be warned and needs to know why it is being removed, by whom and how his device will be impacted. He does not want to be surprised when items disappear.

- **Service Provider**: The service provider regularly updates the Look and Feel in its users’ devices, and when a subscription expires it needs to know what LFC content must be removed and which devices host this content currently. It also needs to trust the device that it actually deleted an item when it says it did.

- **LFC Management Server**: The LFC Management Server issues and handles the commands to perform the LFC Operations. This server can reside under different authorities, such as service provider itself or network operator.

B.1.1.3 Pre-conditions

- The device is able to establish a session with the LFC Management Server.
- User’s subscription has expired.
- Device hosts LFC content that needs to be deleted.
- Service Provider has recognised that a subscription has expired and has initiated the appropriate process.

B.1.1.4 Post-conditions

- The LFC content on the device has been updated/deleted.
- The device is able to function normally post update/deletion of LFC content.
- The LFC Management Server is informed of the outcome of the LFC Operation.

B.1.1.5 Normal Flow

1. Periodically the Service Provider instructs the LFC Management Server to establish a new session with the device in order to update the device Look and Feel. [A1]
2. LFC Management Server issues a command to the device asking whether the user would like to download and install the new LFC content available
3. The user decides to accept and the content is downloaded and installed updating the previous LFC content

B.1.1.6 Alternative Flow 1

1. The Service Provider has detected that a subscription has expired and instructs the LFC Management Server to establish a new session with the device in order to delete the LFC content associated with the subscription.
2. LFC Management Server issues a command to the device in order to delete the LFC content.
3. The User is notified about pending deletion and requested confirmation. [A2]
4. User elects to accept deletion attempt (allows deletion to proceed).
5. The LFC content is deleted from the device and the Default value for the LFC Element(s) deleted, if one exists, is reinstated.

B.1.1.7 Alternative Flow 2

After step (2)

3. The LFC Client notifies the User about pending deletion but does not request confirmation (presents informative message).
4. The LFC content is deleted from the device and the Default value for the LFC Element(s) deleted, if one exists, is reinstated.

B.1.1.8 Operational and Quality of Experience Requirements

The User must be kept fully informed during the update and deletion process – what is being done, when, why, by whom, what will be the impact on his/her device, and what the end result will be.

B.1.2 Actor specific benefits

- **User**: The user has his phone frequently updated with a new Look and Feel and, when his subscription expires the task of deleting content is handled by someone/something else. He can be confident his device only contains content he is entitled to.
- **Service Provider**: Service provider obtains revenue from the LFC subscription service and can ensure that LFC content is being used within the terms of the subscription agreement.

B.2 Device’s Portable Look and Feel

B.2.1 Short Description

Debbie has bought a subscription with a service provider named PhoneIT that includes a personalized Secure Removable Card and a device.

During the first use, the device notifies Debbie about the presence of customization data in the Secure Removable Card and Debbie decides to apply this content to the device’s Look and Feel. The device is then customized with the Default service provider’s Look and Feel configuration.

After some minutes she realizes that the sound selection was unpleasant so she starts browsing all the different files also provided by PhoneIT in the Secure Removable Card. When the new selection is done Debbie applies it to the device’s Look and Feel. Debbie then decides to store the new configuration in the Secure Removable Card to make it portable.

B.2.1.1 Actors

- **End User**
- **Service Provider**

B.2.1.2 Actor Specific Issues

- **End User**: Wants to keep her personalized Look and Feel data always portable and available in her Secure Removable Card.
- **Service Provider**: Wants to provide a Default Look and Feel Customization of the end user’s device but also wants to provide customizable capabilities (e.g. given several choices to their customers and providing a mechanism to update Default configuration) in order to enhance the satisfaction of its customers.
B.2.1.3 Pre-conditions

- The Secure Removable Card must be loaded with LFC content and must be able to receive LFC content from the device.
- The Service Provider must define policies in the Secure Removable Card for end-user notification and automatic synchronization.
- The Service Provider should provide credentials needed to allow access and storage of LFC content in the secure removable device.

B.2.1.4 Post-conditions

- The device has a customized Look and Feel.
- The End User can keep device’s Look and Feel in a Secure Removable Card to facilitate device migration.

B.2.1.5 Normal Flow

1. The end user turns the handset on.
2. The device detects the presence of LFC content available in the Secure Removable Card as well as the Service Provider policy.
3. If not yet done, the device verifies the Service Provider policy which defines whether or not the end-user should be notified before applying LFC content to the device’s Look and Feel.
4. The device applies the Default LFC content available in the Secure Removable Card to the device’s Look and Feel.

B.2.1.6 Alternative Flow

5. The end-user explores the different LFC Elements available in the Secure Removable Card.
6. The end-user applies the chosen LFC Elements to the device’s Look and Feel.
7. The end-user stores the customized Look and Feel in the Secure Removable Card.

B.2.1.7 Operational and Quality of Experience Requirements

The End User shall be able to modify any element of the Service Provider’s LFC content available in the Secure Removable Card.

B.2.2 Actor Specific Benefits

- End User: Has an appealing and portable Look and Feel configuration as well as an improved user experience.
- Service Provider: Gets a stronger image among end users.

B.3 Branding Customization

B.3.1 Short Description

Operator X wants to provision the Look & Feel of a specific model of its terminal base. The Operator asks the Original Equipment Manufacturer to provide an LFC “file” or package with all the necessary element settings to customize the phone according to Operator’s branding strategy. In this customization the brand components are requested to be non-modifiable.

B.3.1.1 Actors

- Service Provider.
- Original Equipment Manufacturer.
B.3.1.2 Actor Specific Issues

- **Service Provider**: Wants to customise a specific phone with its own brand. Brand elements should not be modified.
- **Original Equipment Manufacturer**: Needs a framework about how to facilitate Look and Feel Customization of its own mobile phones.

B.3.1.3 Pre-conditions

- LFC enabled device
- Mobile device supports OMA Device Management enabler or any other provisioning mechanism.

B.3.1.4 Post-conditions

- Mobile device is customised with a tailor set of element settings that suits the needs of that particular phone.
- Operator has been provided with a method to easily brand its own terminals
- LFC Elements may be exposed via a Management Object.

B.3.1.5 Normal Flow

1. Service Provider requests an LFC “file” or package from an OEM, which contains LFC Elements to customise the device according to Service Provider’s brand.
2. Service Provider uses a provisioning mechanism to customise the target terminal with this LFC “file” or package.
3. User interaction to accept customisation “file” or package may or may not be requested by the Service Provider.
4. If user confirmation is requested and granted the LFC “file” or package will be rendered on the device. Then the device Look & Feel is adapted according to the set of LFC Elements provided.
5. The device notifies to Service Provider that the operation was successful.

B.3.1.6 Alternative Flow 1

After step (4)

5. The device exposes part or all of the LFC Elements via a Management Object. LFC Elements marked as "non-modifiable" cannot be modified.

B.3.1.7 Alternative Flow 2

After step (4)

5. The LFC “file” or package has been marked as "non-modifiable", then the device should be able to expose part or all LFC Elements via a Management Object but will not be able to change any of these elements.

B.3.1.8 Operational and Quality of Experience Requirements

In some situations the end-user will not be involved in the acceptance of the LFC “file”. This LFC “file” or package may deliver branding information that customises Service Provider framework environment.

B.3.2 Actor Specific Benefits

- **Service Provider**: Able to tailor branding customization to its terminal base.
- **Original Equipment Manufacturer**: Use same process to customise its terminals to different customers.

B.4 Look and Feel Lock/Unlock

B.4.1 Short Description

When an Enterprise provisions some Look and Feel Customization element(s) (e.g. enterprise logo) to the enterprise employee’s device, the Enterprise wants to lock this customization element(s) so that it can not be changed by the User.
After a customisation element is populated and set as Active in the LFC Client, the Enterprise uses the ‘locking’ process to stop the User from being able to swap the element’s value for a different value. At a later time the Enterprise may choose to unlock the element, allowing the User to change the element’s value once more.

If the element has been populated with a file, such as an image, the Enterprise uses the ‘locking’ process to also make it difficult for the User to find this file on the device. This provides the file with some protection from being edited (bit modified or adapted).

B.4.1.1 Actors
- Enterprise
- LFC Management Server
- LFC Client
- User

B.4.1.2 Actor Specific Issues
- Enterprise: The Enterprise would like to protect some Look and Feel customisation element(s) from being changed by the User.
- LFC Management Server: The LFC Management Server issues and handles the commands in the Client.
- User: User is unable to change some Look and Feel customisation element(s).

B.4.1.3 Pre-conditions
- The LFC Client is capable of interfacing with the LFC Management Server.

B.4.1.4 Post-conditions
- The LFC Client Look and Feel Customization element(s) is locked or unlocked.

B.4.1.5 Normal Flow
1. Enterprise instructs the LFC Management Server to establish a new session with the LFC Client in order to lock certain Look and Feel Customization element(s). [A1]
2. LFC Management Server issues a command to the LFC Client to lock the Look and Feel Customization element(s).
3. The LFC Client locks the Look and Feel Customization element(s).
4. The LFC Client sends a notification to the Server, confirming the action and informing of the outcome

B.4.1.6 Alternative Flow
1. Enterprise instructs the LFC Management Server to establish a new session with the LFC Client in order to unlock certain Look and Feel Customization elements
2. LFC Management Server issues a command to the LFC Client to unlock the Look and Feel Customization element(s).
3. The LFC Client unlocks the Look and Feel Customization element(s).
4. The LFC Client sends a notification to the Server, confirming the action and informing of the outcome

B.4.2 Actor Specific Benefits
- Enterprise: Enterprise can protect Look and Feel Customization element(s) from being changed by the user.
- User: User can easily follow the policy of the Enterprise.
B.5  Look and Feel Provisioning Only

B.5.1  Short Description
A user selects LFC content with which to customize his/her device. The LFC content is downloaded and installed on the device. No Remote Management is necessary during or after the download and installation.

B.5.1.1  Actors
- User
- Device
- LFC Content Server

B.5.1.2  Actor Specific Issues
- User: The user would like to have his/her device customized with a trendy Look and Feel.
- Device: Supports the installation of LFC content but does not support Remote Management
- LFC Content Server: Supports the delivery of LFC content but does not support Remote Management

B.5.1.3  Pre-conditions
- The device is able to connect to the LFC Content Server
- All the actors participating in the flow have the necessary authority to perform the LFC Operations
- The device supports the installation of LFC content but does not support Remote Management

B.5.1.4  Post-conditions
- The device is customized with the desired content.

B.5.1.5  Normal Flow
1. User selects the desired customization content
2. A connection is establish between the device and the LFC Content Server
3. The LFC content is downloaded to the device and appropriate checks are made (user confirmation, sufficient memory, specification version check etc.)
4. The LFC content is installed on the device
5. Once installed on the device, the LFC content is never managed by any remote authority
6. Later, the installed LFC content may be removed by the user, and revert to the Default setting, or be overwritten by new LFC content downloaded by the user
7. When new LFC content is installed, only the LFC Elements that are specified by the new LFC are overwritten. The elements that are not specified by the new LFC content remain unchanged

B.5.2  Actor Specific Benefits
- User: The user has his/her device customized with a new Look and Feel.
- Device: Can offer the ability to customize Look and Feel without the need for Remote Management client software
- LFC Content Server: Is able to deliver Look and Feel content without the need for Remote Management server software. This will lower the barriers to entry into the LFC business for content providers.
B.6  Network triggered delivery

Note: The Network Triggered requirements have been finally removed from the LFC 1.0 specification

B.6.1  Short Description
Nico is a Ferrari fan and very interested in Formula 1 racing. As a result he subscribes to the Ferrari Formula 1 mobile lifestyle and experience. Within this subscription Nico receives as set of mobile artefacts that will form his Ferrari user experience. In addition he also wants to have the new packages from Ferrari as they appear and made available. These updates are normally in relationship to the next race that happens every 2 weeks. Given that each race happens in a different location around the world Ferrari has chosen the approach to provide a unique experience for each. Nico wants to be part of this has therefore subscribed to the automatic update of the LFC content from Ferrari.

B.6.1.1  Actors
  o User
  o Device
  o LFC Content Server

B.6.1.2  Actor Specific Issues
  o User: The user would like to have his/her device customized with the latest and updated Ferrari experience.
  o Device: Can receive LFC packages from the network and support the installation of LFC content.
  o LFC Content Server: Supports the automatic delivery of LFC content to the subscribers device based on the subscribers personal data

B.6.1.3  Pre-conditions
  o The LFC Content Server is able to address the device using the user’s preferences data.

B.6.1.4  Post-conditions
  o The device is customized with the relevant LFC content from Ferrari.

B.6.1.5  Normal Flow
1. User subscribes to the Ferrari Mobile experience and selects the automatic update of LFC content
2. The LFC content is pushed to the device and appropriate checks are made (user confirmation, sufficient memory, specification version check etc.)
3. The LFC content is installed on the device
4. Once installed on the device, the LFC content is never managed by any remote authority
5. Later on a new LFC content is made available from Ferrari. The content server retrieves Nico’s preferences and automatically downloads the new package to Nico’s device
6. The new package when installed on the device overwrites the previous version.

B.6.2  Actor Specific Benefits
  o User: The user has his/her device customized with the latest and greatest Look and Feel from Ferrari
  o Device: Can offer the ability to customize Look and Feel without the need for Remote Management client software
  o LFC Content Server: Is able to deliver Look and Feel content without the need for Remote Management server software. This will lower the barriers to entry into the LFC business for content providers. It also is able to deliver LFC content to the user automatically without the user having to do the tedious task every time.
