1. Scope

This specification provides the mapping between the OneAPI profile of Parlay X Web Services [PXPROF] and the corresponding RESTful bindings of Parlay X Web Services [REST_ERP].

The OneAPI profile of Parlay X Web Services specifies profile of a subset of the existing Parlay X SOAP Web Service specifications. This specification contains tables, with information, on what interfaces are mandated in the profile that must be implemented in order to claim that the instance complies with the profile.

The GSMA OneAPI project is addressing deployment and operational considerations for 3rd party applications, and is re-using a subset of the Parlay X and ParlayREST Web Services APIs for this. It aims to reduce the effort and time needed to create applications and content that is portable across mobile operators.

4. Introduction

The OneAPI profile of the Parlay X web services [PXPROF] defines a subset of the interfaces and operations that must be supported by any entity conforming to the profile. For example, for the SMS enabler the profile mandates support for the sendSms operation of the SendSms interface, but the profile does not mandate support for sendSmsLogo or sendSmsRingtone. The profile does not change the operations themselves in any way, e.g. parameters, whether optional or mandatory, behaviour, etc.

This specification provides the mapping from the OneAPI profile of Parlay X Web Services [PXPROF] and the corresponding RESTful bindings of Parlay X Web Services [REST_ERP].

For each interface and method defined in [PXPROF], the corresponding section in the corresponding ParlayREST section is provided. This specification does not define any static conformance requirements on its own, but rather refers to the requirements specified in [PXPROF] as they cover the same functionality.

4.1 Version 1.0

The first version of the profile contains tables for SMS, MMS, Terminal location and Payment as specified in the following chapter.

Appendix B. Static Conformance Requirements (Normative)

This specification only provides a mapping from a set of functionalities defined in [REST_ERP] to a set of functionalities defined in [PXPROF]. Therefore, no own static conformance requirements are given. Instead, the applicable static conformance requirements are defined in [PXPROF].
