SyncML Representation Protocol, version 1.1

Abstract
This document specifies the common XML syntax and semantics used by all SyncML protocols.

1 Introduction

This document specifies the common XML syntax and semantics used by all SyncML protocols.

The SyncML representation protocol is defined by a set of messages that are conveyed between entities participating in a SyncML operation. The messages are represented as an XML document. XML is the industry standard for text document mark-up, as defined in [6].

The SyncML representation protocol also can be identified as a MIME content type. MIME is the Internet standard for identifying multipurpose message contents. It provides a useful mechanism for differentiating between different content and document types.

The SyncML representation protocol supports protocol models that are based on a request/response command structure, as well as those that are based on a "blind push" command structure.

The SyncML representation protocol embodies the concept of a SyncML Package. The SyncML Package performs some set of operations. This conceptual "package" permits either a "batch" of multiple operations put together in a single SyncML Message or conveyed as separate SyncML Messages, each containing a single operation. SyncML Messages are the body of the MIME entities.

2 Formatting Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY" and "OPTIONAL" in this document are to be interpreted as described in [5].

Any reference to components of the SyncML DTD or XML snippets is specified in this typeface.

3 Terminology

This section defines terminology used throughout the specification.

application
A SyncML application that supports the SyncML protocol. The application can either be the originator or recipient of the SyncML protocol commands. The application can act as a SyncML client or a SyncML server.

capabilities exchange
The SyncML capability that allows a client and server to exchange what device, user and application features they each support.

client
A SyncML Client refers to the protocol role when the application issues SyncML "request" messages. For example in data synchronization, the Sync SyncML Command
in a SyncML Message.

**command**

A SyncML Command is a protocol primitive. Each SyncML Command specifies to a recipient an individual operation that is to be performed. For example, the SyncML Commands supported by this specification include Add, Alert, Atomic, Copy, Delete, Exec, Get, Map, Replace, Search, Sequence and Sync.

**data**

A unit of information exchange, encoded for transmission over a network.

**data collection**

A data element which acts as a container of other data elements, (e.g., \{c \{i_1, data_1\}, ... \{i_n, data_n\}\}). In SyncML, data collections are synchronized with each other. See **data element**.

**data element**

A piece of data and an associated identifier for the data, (e.g., \{i, data\}).

**data element equivalence**

When two data elements are synchronized. The exact semantics is defined by a given data synchronization model.

**data exchange**

The act of sending, requesting or receiving a set of data elements.

**data format**

The encoding used to format a data type. For example, characters or integers or character encoded binary data.

**data type**

The schema used to represent a data object (e.g., text/calendar MIME content type for an iCalendar representation of calendar information or text/directory MIME content type for a vCard representation of contact information).

**data synchronization**

The act of establishing an equivalence between two data collections, where each data element in one item maps to a data item in the other, and their data is equivalent.

**data synchronization protocol**

The well-defined specification of the "handshaking" or workflow required to accomplish synchronization of data elements on an originator and recipient data collection. The SyncML specification forms the basis for specifying an open data synchronization protocol.

**message**

---

Copyright © 2000-2002 Ericsson, IBM, Lotus, Matsushita Communications Industrial Co., Ltd., Motorola, Nokia, Openwave, Palm, Psion, Starfish Software, Symbian, and others. All Rights Reserved.
A SyncML Message is the primary contents of a SyncML Package. It contains the SyncML Commands, as well as the related data and meta-information. The SyncML Message is an XML document.

**operation**

A SyncML Operation refers to the conceptual transaction achieved by the SyncML Commands specified by a SyncML Package. For example in the case of data synchronization, "synchronize my personal address book with a public address book".

**originator**

The network device that creates a SyncML request.

**package**

A SyncML Package is the complete set of commands and related data elements that are transferred between an originator and a recipient. The SyncML package can consist of one or more SyncML Messages.

**parser**

Refers to an XML parser. An XML parser is not absolutely required to support SyncML. However, a SyncML implementation that integrates an XML parser may be easier to enhance.

This document assumes that the reader has some familiarity with XML syntax and terminology.

**recipient**

The network device that receives a SyncML request, processes the request and sends any resultant SyncML response.

**representation protocol**

A well-defined format for exchanging a particular form of information. SyncML is a representation protocol for conveying data synchronization and device management operations.

**SyncML request message**

An initial SyncML Message that is sent by an originator to a recipient network device.

**SyncML response message**

A reply SyncML Message that is sent by a recipient of a SyncML Request back to the originator of the SyncML Request.

**synchronization data**

Refers to the data elements within a SyncML Command. In a general reference, can also refer to the sum of the data elements within a SyncML Message or SyncML Package.

**server**

A SyncML Server refers to the protocol role when an application issues SyncML "response" messages. For example in the case of data synchronization, a Results Command in a SyncML Message.
4 SyncML

4.1 SyncML Package and Messages
In SyncML, the operations are conceptually bound into a **SyncML Package**. The SyncML Package is just a conceptual frame for one or more **SyncML Messages** that are required to convey a set of protocol semantics.

A SyncML Message is a well-formed, but not necessarily valid, XML document. The document is identified by the **SyncML** root or document element type. This element type acts as a parent container (i.e., root element type) for the SyncML Message.

The SyncML Message, as specified before, is an individual XML document. The document consists of a header, specified by the **SyncHdr** element type, and a body, specified by the **SyncBody** element type. The SyncML header specifies routing and versioning information about the SyncML Message. The SyncML body is a container for one or more **SyncML Commands**. The SyncML Commands are specified by individual element types. The SyncML Commands act as containers for other element types that describe the specifics of the SyncML command, including any data or meta-information.

4.2 SyncML Commands
SyncML defines the following "request" commands:

- **Add.** Allows the originator to ask that a data element or data elements supplied by the originator be added to data accessible to the recipient.

- **Alert.** Allows the originator to notify the recipient. The notification can be used as an application-to-application message or a message intended for display through the recipient's user interface.

- **Atomic.** Allows the originator to indicate that a set of commands to be performed with all or nothing semantics.

- **Copy.** Allows the originator to ask that a data element or data elements accessible to the recipient be copied.

- **Delete.** Allows the originator to ask that a data element or data elements accessible to the recipient be deleted. A **Delete** command can include a request for the archiving of the data.

- **Exec.** Allows the originator to ask that a named or supplied executable is invoked by the recipient.

- **Get.** Allows the originator to ask for a data element or data elements from the recipient. A get can include the resetting of any meta-information that the recipient maintains about the data element or collection.
SyncML defines the following "response" commands:

• Status. Indicates the completion status of an operation or that an error occurred while processing a previous request.

• Results. Used to return the data results of either a Get or Search SyncML Command.

The SyncML Commands themselves do not fully define the semantics of the SyncML Operation. For example, "Adding" a document to an application to a database may have very different semantics from "Adding" a transaction request to a queue. The semantics of a SyncML Operation are determined by the type of data that is being operated upon. This means that it is possible for an originator to request an operation of a particular recipient that makes no sense to the recipient. In that case, the recipient MUST return an error response status code.

4.3 Security

An objective of SyncML is to provide a framework for secure operation. SyncML itself does not define any new security schemes. Instead, it provides the framework to challenge authentication, authentication, authorization and inclusion of encrypted data in a SyncML Package. In addition, the originator and recipient may use the security mechanisms of the underlying transport to authenticate each other and to provide a secure transport for the exchange of SyncML Packages.

SyncML can be used by an originator to encapsulate authentication information in the Cred element type. Implementations conforming to this specification MUST support the "Basic" and "MD5 Digest" schemes.

SyncML can also be used to allow an originator to challenge the authentication of a recipient with the Chal element type. Not all authentication schemes provide a challenge mechanism. However, the MD5 Digest scheme does provide such a capability.
The Basic scheme is identified by the URI syncml:auth-basic. This authentication scheme is a Base64 character encoding, as defined by Section 6.8, "Base64 Content-Transfer-Encoding" in [4], of the concatenation of the originator’s userid, followed by the COLON (i.e., ":") separator character, followed by the password associated with the specified userid. This authentication scheme is susceptible to the threat of network eavesdrop, but is simple to implement. However, care should be taken when using this scheme. For example, a user is strongly advised to consider using additional security considerations, such as an encrypted transport connection.

The MD5 Digest scheme is identified by the URI syncml:auth-md5. Let MD5(data) denote the result of applying the MD5 hash algorithm to “data”, the result is a 128-bit binary quantity. Let A be the concatenation of an authentication identifier as the originator’s userid, followed by the COLON (i.e., ":") separator character, followed by some secret known by the originator and recipient such as the originator’s password for the corresponding userid, for instance:

A="Bruce1:OhBehave"

Let AD be defined as:

AD = MD5(A)

Let B64(data) denote the result of the base64 encoding algorithm applied to “data”. This authentication scheme is the MD5 digest form of the concatenation of B64(AD), followed by the COLON (i.e., ":") separator character, followed by the recipient specified nonce string. The maximum duration that the nonce string can be used by the originator is the current SyncML session. Note that issuing a nonce does not constitute use – a nonce may be issued for use in the next session. More frequent changes to the nonce string can be specified with the NextNonce element type within the Meta element type of the Chal element type. The MD5 digest algorithm and a publicly available source code for generating MD5 digest strings is specified by [3]. The MD5 credential, a 128-bit binary digest value, MUST be Base64 character encoded when transferred as clear-text XML. For WBXML representation, the additional Base64 character encoding is not necessary.

Other authentication schemes can be specified by prior agreement between the originator and the recipient.

The authentication procedures for the SyncML Data Synchronization protocol are defined in [11]. The authentication procedures for the SyncML Device Management protocol are defined in [9].

To specify the userid for the credentials, when the credentials do not include it in the resolvable form, the userid MUST be transferred in the LocName element of Source in SyncHdr. If the userid can be resolved from the credentials, e.g., in the case of the Basic authentication, it can be omitted from the LocName element to reduce the number of bytes to be transferred.

```
<SyncML xmlns="SYNCML:SYNCML1.1">
  <SyncHdr>
    <VerDTD>1.1</VerDTD>
  </SyncHdr>
```
4.4 XML Usage

The SyncML Messages are represented in a mark-up language defined by [6]. The SyncML representation protocol is an XML application. The SyncML DTD (Document Type Definition) defines the XML document type used to represent a SyncML Message. The SyncML DTD can be found in Section 7, but it is not necessary to read the DTD in order to understand the protocol.

SyncML Messages are specified using well-formed XML. However, the SyncML Messages need not be valid XML. That is, the SyncML Messages do not need to specify the XML declaration or prolog. They only need to specify the body of the XML document. This restriction allows for the SyncML Messages to be specified with greater terseness than well-formed, valid XML documents.

SyncML makes heavy use of XML name spaces. Name spaces MUST be declared on the first element type that uses an element type from the name space.

Names in XML are case sensitive. By convention in the SyncML DTD, the element type and attribute list names are specified using the convention that the first character in each word of the name is in upper case text and remainder of the characters in each word of the names specified in lower case text. For example, SyncML for the Sync Mark-up Language tag or MsgRef for the Message Reference tag.

The element types in the SyncML DTD are defined within a namespace associated with the URI http://www.syncml.org/docs/syncml_represent_v11_20020213.dtd or the URN syncml:syncml. The SyncML DTD are also identified by the ISO 9070 formal public identifier -//SYNCML//DTD SyncML 1.1//EN.
SyncML also makes use of XML standard attributes, such as xml:lang. Any XML standard attribute can be used in a SyncML document.

XML can be viewed as more verbose than alternative binary representations. This is often cited as a reason why it may not be appropriate for low bandwidth network protocols. In most cases, SyncML uses shortened element type and attribute names. This provides a minor reduction in verbosity. Additionally, the SyncML Messages can be encoded in a tokenized, binary format defined by [12]. The use of [12] format is external to specification of the SyncML protocol and should be transparent to any SyncML application. The combination of the use of shortened element type names and an alternative binary format makes SyncML competitive, from a compressed format perspective, with alternative, but private, binary representations.

One of the main advantages of XML is that it is a widely accepted International recommendation for text document mark-up. It provides for both human readability and machine processability. In addition, XML allows the originator to capture the structure of a document, not just its content. This is extremely useful for applications such as data synchronization, where not just content, but structure semantics is often exchanged.

### 4.5 MIME Usage

The [4] Internet standard provides an industry-accepted mechanism for identifying different content types. The SyncML Message is identified by a MIME media type. The media type for the SyncML Message is registered within the vendor tree. The MIME content types for SyncML Data Synchronization are specified in [1]. The MIME content types for SyncML Device Management are specified in [2]. One of these MIME content types MUST be used for identifying SyncML Messages within transport and session level protocols that support MIME content types.

### 4.6 Identifiers

Identifiers in SyncML, such as in the Source or Target element types, can be a combination of Uniform Resource Identifiers (URI), as defined by [8], Uniform Resource Names (URN) and textual names.

In SyncML, all URI and URN values are specified as parsable character data in element types or as character data in attribute lists. Applications MUST specify a valid URI or URN value. Even with an integrated "validating XML parser", as defined in [6], an application will need to confirm the validity of any URI or URN.

SyncML uses the IMEI URN type to identify an International Mobile Equipment Identifiers [7]. The IMEI URN specifies a valid, 15 digit IMEI. In addition, SyncML uses the SYNCML URN type to identify SyncML specific name spaces and unique names. Other URN types may be used in the LocURI element type also.

### 5 Mark-up Language Description

The SyncML representation protocol is a document mark-up consisting of XML element types. This section provides a prose description of this mark-up. The element types are
defined in terms of their purpose or usage, parent elements, any restrictions on content or use and content model.

In the "Attributes" section for the description for each element type, the text "None." means no SyncML-specific attributes are defined. However, XML standard attributes can still be used within these element types.

Restrictions listed in this document apply to all SyncML protocols. Any additional restrictions for each protocol and examples that illustrate the use of each element type can be found in the representation protocol usage documents [1] and [2].

5.1 Common Use Elements
The following are common element types used by numerous other SyncML element types.

5.1.1 Archive

Usage: Indicator that the data specified in the Delete command SHOULD be archived (e.g., a copy kept) by the recipient prior to being deleted from the recipient data collection.

Parent Elements: Delete

Content Model:

(EMPTY)

Attributes: None.

5.1.2 Chal

Usage: Specifies an authentication challenge. The receiver of the challenge specifies authentication credentials, of the given authentication type and format, in the next request.

Parent Elements: Status

Restrictions: The Meta element type specifies any meta-information about the challenge. The Type and Format element types within the Meta element type specify the authentication scheme type and format, respectively. The default type is syncml:auth-basic for the SyncML "Basic" form of authentication. The type value syncml:auth-md5 MUST be explicitly specified to indicate the SyncML "MD5 Digest Access" authentication scheme. If the SyncML "MD5 Digest Access" authentication scheme is used, the NextNonce element type can be specified if the challenger requests the use of a new nonce string. The format value MUST be b64, when using the clear-text, XML representation. The types for the SyncML authentication schemes are specified in Section 4.3, "Security", of this specification.

An authentication challenge can be specified for each of a number of SyncML "security layers". For example, a challenge can be specified against the SyncML server, database or an individual command on a database. To challenge a SyncML server, a Chal element type is sent in the Status command corresponding to the SyncHdr of the associated SyncML request. To challenge a database, the Chal element type is sent in the Status
command corresponding to the Alert or Sync command associated with the database. To challenge a command on a database, the Chal element type is sent in the Status command corresponding to an individual command (e.g., Add, Alert, Delete) on the database. Mechanisms for authentication challenges at the transport level are handled within the individual transport.

If absent and if the status code is (200) OK, then the same credentials MUST be used in the next SyncML request.

If absent and if the status code is (212) Authentication accepted, then credentials need not be specified for any subsequent SyncML requests within the current session. The session is authenticated.

Content Model:

```
(Meta)
```

Attributes: None.

5.1.3 Cmd

Usage: Specifies the name of the SyncML command referenced by a Status element type.

Parent Elements: Status

Restrictions: The value MUST be one of Add, Alert, Atomic, Copy, Delete, Exec, Get, Map, Put, Replace, Results, Search, Sequence, Status, Sync.

Content Model:

```
(#PCDATA)
```

Attributes: None.

5.1.4 CmdID

Usage: Specifies a SyncML message-unique command identifier.

Parent Elements: Add, Alert, Atomic, Copy, Delete, Exec, Get, Map, Put, Replace, Results, Search, Sequence, Status, Sync

Restrictions: A text value that MUST be unique within the SyncML Message. The element type MUST always be present and the value MUST NOT be the text string "0".

Content Model:

```
(#PCDATA)
```

Attributes: None.
5.1.5 CmdRef

Usage: Specifies the CmdID referenced by a Status element type.

Parent Elements: Results, Status

Restrictions: MUST refer to the identifier of the SyncML command reference by the Status element type.

The only instance where the element type can be absent in the Status command is the case where the Status command refers to the SyncHdr of the associated SyncML request message. For example, a status can be sent back to the originator for exceptions (e.g., (401) Unauthorized) found within the SyncHdr of the originator’s request.

Content Model:

```
(#PCDATA)
```

Attributes: None.

5.1.6 Cred

Usage: Specifies an authentication credential for the originator.

Parent Elements: Add, Alert, Copy, Delete, Exec, Get, Put, Map, Replace, Search, Status, Sync, SyncHdr

Restrictions: The Meta element type specifies any meta-information about the credentials. The Type and Format element types within the Meta element type specify the credential scheme type and format, respectively. The default type is syncml:auth-basic for the "Basic" form of authentication. The type value syncml:auth-md5 MUST be explicitly specified to indicate the SyncML "MD5 Digest" authentication scheme. The format MUST be b64, when using the clear-text, XML representation. However, when using "Basic" form of authentication, the b64 format does not indicate that the credentials are base64 encoded twice. The Data element type specifies the credential value. The types for these SyncML authentication schemes are specified in Section 4.3, "Security", of this specification.

If absent, and no other authentication credential was specified in either a parent command or in the SyncHdr element type, then no authentication credential is specified.

If an authentication credential was specified by a parent command or in the SyncHdr element type, then that authentication credential specified there is assumed to be sufficient for the operation specified by the current element type. Specifying insufficient authentication credentials will result in a (401) Unauthorized exception condition.

If the authentication challenge is received (See the Chal element type) for the request, the credential type and format of the next request MUST be applied to it.

Content Model:

```
(Meta?, Data)
```
Attributes: None.

5.1.7 Final

Usage: Indicator that the SyncML message is the last message in the current SyncML package.

Parent Elements: SyncBody

Restrictions: The element type MUST only be specified on the last message of the SyncML package. If not present, then more messages follow this SyncML message in the current SyncML package.

Content Model:

(EMPTY)

Attributes: None.

5.1.8 Lang

Usage: Specifies a preferred language for results data on a Get, Put or Search command (i.e., commands that return text results).

Parent Elements: Get, Put, Search

Content Model:

(#PCDATA)

Attributes: None.

5.1.9 LocName

Usage: Specifies the display name for the target or source address.

Parent Elements: Target, Source

Content Model:

(#PCDATA)

Attributes: None.

5.1.10 LocURI

Usage: Specifies the target or source specific address.
Parent Elements: Target, Source

Restrictions: MUST be either an absolute or a relative URI or a well-known URN.

Content Model:

(#PCDATA)

Attributes: None.

5.1.11 MoreData

Usage: Indicator that a SyncML data element is incomplete and there will be one or more subsequent chunks.

Parent Elements: Item

Restrictions: The element type MUST be specified on all but the last chunk of data of an item. If not present, then the item is either contained within a single message or is the closing chunk of the data item.

Content Model:

(EMPTY)

Attributes: None.

5.1.12 MsgID

Usage: Specifies a SyncML session-unique identifier for the SyncML Message.

Parent Elements: SyncHdr

Restrictions: The message identifier MUST be unique to the device within the SyncML session. The element type MUST be specified in the SyncHdr. The value is a monotonically increasing numeric value starting at one (1) for the first message in the SyncML session. The message identifier specified in a SyncML request MUST be the content of the MsgRef element type in the corresponding SyncML results or response status.

Content Model:

(#PCDATA)

Attributes: None

5.1.13 MsgRef

Usage: Specifies a reference to a SyncML session-unique identifier referenced by a SyncML results or response status.

Parent Elements: Results, Status
Restrictions: The value MUST reference the message identifier of the SyncML message referred to by the results or response status.

Content Model:

```xml
(#PCDATA)
```

Attributes: None

5.1.14 NoResp

Usage: Indicates that the originator does not want a response status sent back in the response message.

Parent Elements: Add, Alert, Atomic, Copy, Delete, Exec, Get, Put, Replace, Search, Sequence, Sync, and SyncHdr

Content Model:

```xml
(EMPTY)
```

Attributes: None

5.1.15 NoResults

Usage: Indicates that the results of a Search command MUST be retained on the recipient to be used as the source for a subsequent SyncML command.

Parent Elements: Search

Content Model:

```xml
(EMPTY)
```

Attributes: None

5.1.16 NumberOfChanges

Usage: Indicates the total number of changes (the number of Add, Replace and Delete commands) that are going to be sent from sender to recipient during a synchronization session so that the recipient may use this information to calculate progress information.

Parent Elements: Sync

Content Model:

```xml
(#PCDATA)
```

Attributes: None.
5.1.17 RespURI

**Usage:** Specifies the URI that the recipient MUST use for any response to this message.

**Parent Elements:** SyncHdr

**Restrictions:** The value of this element is the address, in the form of an absolute URI that the recipient MUST use for any response to this message. If the Source is not the same as this value, then the Source element MUST also be specified in the SyncHdr element type. Note that the server and databases are the same entities at this new address. Receipt of this command does not mean you should repeat commands in the previous message.

**Content Model:**

```
(#PCDATA)
```

**Attributes:** None.

5.1.18 SessionID

**Usage:** Specifies the identifier of the SyncML session associated with the SyncML Message.

**Parent Elements:** SyncHdr

**Restrictions:** The value is an opaque string. The element type MUST be specified in the SyncHdr element type in all SyncML Messages. The initiator SHOULD use unique SessionIDs for each session.

**Content Model:**

```
(#PCDATA)
```

**Attributes:** None

5.1.19 SftDel

**Usage:** Indicates that the delete command is a "Soft Delete".

**Parent Elements:** Delete

**Content Model:**

```
EMPTY
```

**Attributes:** None

5.1.20 Source

**Usage:** Specifies source routing or mapping information.

**Parent Elements:** Item, Map, MapItem, Search, Sync, SyncHdr,
Restrictions: When specified in the Item element type, the Source element type specifies the database item that is the source of the SyncML command.

When specified in the SyncHdr element type, the Source element type specifies the source routing information for the network device that originated the SyncML Message.

If the RespURI element type is also specified within the SyncHdr, then the Source element type specifies the source routing information for a proxy originator of the SyncML message.

Content Model:

```
(LocURI, LocName?)
```

Attributes: None.

5.1.21 SourceRef

Usage: Specifies the Source referenced by a Status or Results element type

Parent Elements: Status, Results

Restrictions: When specified in the Status element type, specifies the source address specified in the command associated with the response status. When specified in the Results element type, specifies the source address specified in the associated Search command.

The element type MUST be specified in a Status command corresponding to any SyncML command that includes the Source element type.

Content Model:

```
(#PCDATA
```

Attributes: None.

5.1.22 Target

Usage: Specifies target routing or mapping information.

Parent Elements: Item, Map, MapItem, Search, Sync, SyncHdr,

Restrictions: When specified in the Item element type, the Target element type specifies the database item that is the target of the SyncML command.

When specified in the SyncHdr element type, the Target element type specifies the target routing information for the network device that is receiving the SyncML Message.

Content Model:

```
(LocURI, LocName?)
```
5.1.23 TargetRef

**Usage:** Specifies the Target referenced by a Status or Results element type

**Parent Elements:** Status, Results

**Restrictions:** When specified in the Status element type, specifies the target address specified in the command associated with the response status. When specified in the Results element type, specifies the target address specified in the associated Search command.

The element type MUST be specified in a Status command corresponding to any SyncML command that includes the Target element type.

**Content Model:**

```
(#PCDATA)
```

**Attributes:** None.

5.1.24 VerDTD

**Usage:** Specifies the major and minor version identifier of the SyncML representation protocol specification used to represent the SyncML message.

**Parent Elements:** SyncHdr

**Restrictions:** Major revisions of the specification create incompatible changes that will generally require a new SyncML parser. Minor revisions involve changes that do not impact basic compatibility of the parser. When the XML document conforms to this revision of the SyncML representation protocol specification the value MUST be 1.1. The element type MUST be included in the SyncHdr.

**Content Model:**

```
(#PCDATA)
```

**Attributes:** None.

5.1.25 VerProto

**Usage:** Specifies the major and minor version identifier of the SyncML protocol specification used with the SyncML Message.

**Parent Elements:** SyncHdr

**Restrictions:** The first SyncML Message in each SyncML Package sent from an originator to a recipient MUST include the VerProto element type in the SyncHdr.

**Content Model:**

```
(#PCDATA)
```
5.2 Message Container Elements

The following element types provide the basic container support for the SyncML message.

5.2.1 SyncML

Usage: Specifies the container for a SyncML Message.

Parent Elements: None. This is the root or document element.

Content Model:

(attributes)

Attributes: None.

5.2.2 SyncHdr

Usage: Specifies the container for the revisioning, routing information in the SyncML message.

Parent Elements: SyncML

Restrictions: The optional Meta is used to convey meta-information about the SyncML messages, such as the maximum byte size of a SyncML response.

Content Model:

((VerDTD, VerProto, SessionID, MsgID, Target, Source, RespURI?, NoResp?, Cred?, Meta?),
VerDTD, VerProto, SessionID, MsgID, Target, Source, RespURI?, NoResp?, Cred?, Meta?))

Attributes: None

5.2.3 SyncBody

Usage: Specifies the container for the body or contents of the SyncML message.

Parent Elements: SyncML

Restrictions: None.

Content Model:

((Alert | Atomic | Copy | Exec | Get | Map | Put | Results | Search |
Sequence | Status | Sync | Add | Replace | Delete)+, Final?)

Attributes: None.
5.3 Data Description Elements

The following element types are used as container elements for data exchanged in a SyncML Message.

5.3.1 Data

Usage: Specifies discrete SyncML data.

Parent Elements: Alert, Cred, Item, Status, Search

Restrictions: The content information can be either parsable character data or mark-up data. If the element type contains any mark-up, then the name space for the element types MUST be declared on the element types in the content information.

When specified in an Alert, the element type specifies the type of alert.

When specified in a Cred, the element type specifies the authentication credentials.

When specified in an Item, the element type specifies the item data.

When specified in a Status, the element type specifies the request status code type.

Content Model:

```
(#PCDATA)
```

Attributes: None.

5.3.2 Item

Usage: Specifies a container for item data.

Parent Elements: Add, Alert, Copy, Delete, Exec, Get, Put, Replace, Results, Status

Restrictions: If the source URI for the data is an external entity, then the Data element is absent. In this case, the recipient will need to retrieve the data from the specified network location.

The LocURI element type in the Target or Source element types for any of the SyncML commands can be a relative URL. This restriction is not captured by the SyncML DTD.

When specified in an Add, Copy, Delete, Exec, Get, Put, Replace, or Results command, the element type specifies data item that is the operand for the command.

When specified in an Alert, the element type specifies the parameters for the alert type.

When specified in a Status, the element type specifies additional information about the request status code type. For example, it might specify the component of the request that caused the status condition.
Content Model:

(Target?, Source?, Meta?, Data?)

Attributes: None.

5.3.3 Meta

Usage: Specifies meta-information about the parent element type.

Parent Elements: Add, Atomic, Chal, Copy, Cred, Delete, Get, Item, Map, Put, Replace, Results, Search, Sequence, Sync

Restrictions: When specified in the Chal, the element type specifies meta-information about the authentication scheme requested.

When specified in the Cred, the element type specifies meta-information about the authentication credential.

When specified in the Atomic, Sequence and Sync, then the scope for the meta-information includes all the contained commands, unless the meta-information is overridden by a Meta in a contained command.

When specified in the Results, the element type specifies meta-information about the results set.

When specified in the Add, Copy, Delete, Get, and Replace commands, the element type specifies meta-information about the SyncML command.

Content Model:

(#PCDATA)

Attributes: None.

5.4 Protocol Management Elements

5.4.1 Status

Usage: Specifies the request status code for a corresponding SyncML command.

Parent Elements: SyncBody

Restrictions: A Status command only applies to the command corresponding to the specified CmdRef (i.e., 1:1 correspondence of a command and a Status). If there were multiple Item elements specified in the command, and if the items' status code were not the same, then a Status MUST be returned for each of the items. If all of the items had the same status code, a Status for all of the items MAY be returned. In these cases the SourceRef and TargetRef elements are used to identify the Item, which the status code applies to. If all of the items in the command had the same status code, then it is also allowed to return a single Status for the entire command. When returning a single Status
for a command with multiple items, the SourceRef and TargetRef elements MUST NOT be specified in the Status command.

Additionally, if the Status command is associated with a command that had other commands inside it (e.g., Sync, Atomic, Sequence), then the status value only applies to the corresponding command, and is not related to the status of the commands inside it.

Ordering of Status commands in a SyncML response MUST match the order of the commands in the corresponding SyncML request. That is, when there are multiple commands in a SyncML request, then the corresponding Status commands MUST appear in the SyncML response in the same order as the associated commands appeared in the SyncML request.

The CmdID element type specifies the SyncML message-unique identifier for this command.

The MsgRef element type specifies the MsgID of the associated SyncML request.

The CmdRef element type specifies the CmdID of the associated SyncML request. The element type MUST be present. If "0", the Status command corresponds to a status code for the SyncHdr of the SyncML message referenced by the Status command.

The Cmd element type specifies the name of the SyncML command associated with the SyncML request. The value of the element type can also be "SyncHdr" when the CmdRef element type has a value of "0".

The optional TargetRef element type specifies the target addresses from the associated command. If the Item elements of the command associated with the Status command has a Target element, the value MUST be copied into the TargetRef of the Status command. If more than one TargetRef element type is specified, then the request status code applies to all of these TargetRef values. If the request status code is applicable to the entire list of items specified in the associated request command, then the TargetRef element type MUST NOT be specified.

The optional SourceRef element type specifies the source address from the associated command. If the Item elements of the command associated with the Status command has a Source element, the value MUST be copied into the SourceRef of the Status command. If more than one SourceRef element type is specified, then the request status code applies to all of these SourceRef values. If the request status code is applicable to the entire list of items specified in the associated request command, then the SourceRef element type MUST NOT be specified.

The Cred element type specifies authentication credential for the command.

The Chal element type specifies the authentication challenge for the command or the message. If the status code in the Data element is (401) Unauthorized or (407) Authentication required, the challenge SHOULD be included.
The Data element type specifies the request status code type.

The optional and repeatable Item element type contains additional information about the status condition, such as the SyncML command.

This specification permits a Status command to be issued against another Status command. This case will probably not normally be encountered. However, there are extreme cases where this feature is necessary. For example, if a server returns a (401) Unauthorized status code with a request for an authentication scheme that is not supported by the client, the client might use a (406) Optional feature unsupported to notify the server that that requested authentication scheme is not supported and negotiate an authentication scheme it does support. SyncML servers and SyncML clients not supporting such a usage case need provide no further response to the SyncML entity issuing the "Status on a Status".

A Status MUST also be returned for the SyncHdr. However, if a client creates a message containing only a successful Status on a SyncHdr, the entire message MUST NOT be sent. A server MUST send this message.

Status codes are listed in Section 11, Response Status Codes.

Content Model:

```
(CmdID, MsgRef, CmdRef, Cmd, TargetRef*, SourceRef*, Cred?, Chal?, Data, Item*)
```

Attributes: None.

5.5 Protocol Command Elements

5.5.1 Add

Usage: Specifies the SyncML command to add data to a data collection.

Parent Elements: Atomic, Sequence, Sync, SyncBody

Content Model:

```
(CmdID, NoResp?, Cred?, Meta?, Item+)
```

Attributes: None.

5.5.2 Alert

Usage: Specifies the SyncML command for sending custom content information to the recipient. The command provides a mechanism for communicating content information, such as state information or notifications to an application on the recipient device. In addition, this command provides a "standard way to specify non-standard" extended commands, beyond those defined in this specification.
Parent Elements: Atomic, Sequence, SyncBody

Restrictions: Alert codes are listed in Section 12, Alert Types.

Content Model:

(CmdID, NoResp?, Cred?, Data?, Item*)

Attributes: None.

5.5.3 Atomic

Usage: Specifies the SyncML command to request that the subordinate commands be executed as a set or not at all.

Parent Elements: Sequence, Sync, SyncBody

Content Model:

(CmdID, NoResp?, Meta?, (Add | Delete | Copy | Atomic | Map | Replace | Sequence | Sync | Get | Exec | Alert)+)

Attributes: None.

5.5.4 Copy

Usage: Specifies that the SyncML command to copy data items from one location to another in the recipient's database.

Parent Elements: Atomic, Sequence, Sync, SyncBody

Content Model:

(CmdID, NoResp?, Cred?, Meta?, Item+)

Attributes: None.

5.5.5 Delete

Usage: Specifies the SyncML command to delete data from a data collection.

Parent Elements: Atomic, Sequence, Sync, SyncBody

Content Model:

(CmdID, NoResp?, Archive?, SftDel?, Cred?, Meta?, Item+)

Attributes: None.
5.5.6 Exec

Usage: Specifies the SyncML command to execute a process on the recipient network device.

Parent Elements: SyncBody, Atomic, Sequence

Content Model:

(CmdID, NoResp?, Cred?, Meta?, Item)

Attributes: None.

5.5.7 Get

Usage: Specifies the SyncML command to retrieve data from the recipient.

Parent Elements: SyncBody, Sequence, Atomic

Content Model:

(CmdID, NoResp?, Lang?, Cred?, Meta?, Item+)

Attributes: None.

5.5.8 Map

Usage: Specifies the SyncML command used to update identifier maps.

Parent Elements: Atomic, Sequence, SyncBody

Content Model:

(CmdID, Target, Source, Cred?, Meta?, MapItem+)

Attributes: None.

5.5.9 MapItem

Usage:

Parent Elements: Map

Content Model:

(Target, Source)

Attributes: None.
5.5.10 Put

**Usage:** Specifies the SyncML command to transfer data items to a recipient network device or database.

**Parent Elements:** SyncBody

**Content Model:**

```
(CmdID, NoResp?, Lang?, Cred?, Meta?, Item+)
```

**Attributes:** None.

5.5.11 Replace

**Usage:** Specifies the SyncML command to replace data.

**Parent Elements:** Atomic, Sequence, Sync, SyncBody

**Content Model:**

```
(CmdID, NoResp?, Cred?, Meta?, Item+)
```

**Attributes:** None.

5.5.12 Results

**Usage:** Specifies the SyncML command that is used to return the results of a Search or Get command.

**Parent Elements:** SyncBody

**Restrictions:** The mandatory **CmdID** element type specifies the SyncML message-unique identifier for this command.

The optional **MsgRef** element type specifies the MsgID of the associated SyncML request. If the **MsgRef** is not present in a **Results** element type, then the **MsgRef** value of "1" MUST be assumed.

The **CmdRef** element type specifies the CmdID of the associated SyncML request. If not present, the response status code is associated with **CmdID** value of "1".

The optional **Meta** element type specifies meta-information to be used for the command. For example, the common media type or format for all the items can be specified. The scope of the meta-information is limited to the command.

The optional **TargetRef** element type specifies the target address from the associated command.

The optional **SourceRef** element type specifies the source address from the associated command.
One or more Item element types MUST be specified. The Item element type specifies the results. The Source specified within the Item element type SHOULD be a relative URI, as relative to the corresponding SourceRef.

Content Model:

\[(\text{CmdID}, \text{MsgRef}?, \text{CmdRef}, \text{Meta}?, \text{TargetRef}?, \text{SourceRef}?, \text{Item}+)\]

Attributes: None

5.5.13 Search

Usage: Specifies the SyncML command to search a recipient database.

Parent Elements: SyncBody

Content Model:

\[(\text{CmdID}, \text{NoResp}? , \text{NoResults}?, \text{Cred}?, \text{Target}?, \text{Source}+, \text{Lang}?, \text{Meta}, \text{Data})\]

Attributes: None.

5.5.14 Sequence

Usage: Specifies the SyncML command to order the processing of a set of SyncML commands.

Parent Elements: Atomic, Sync, SyncBody

Content Model:

\[(\text{CmdID}, \text{NoResp}? , \text{Meta}? , (\text{Add} | \text{Replace} | \text{Delete} | \text{Copy} | \text{Atomic} | \text{Map} | \text{Sync} | \text{Get} | \text{Alert} | \text{Exec}+)\]

Attributes: None.

5.5.15 Sync

Usage: Specifies the SyncML command that indicates a data synchronization operation.

Parent Elements: Atomic, Sequence, SyncBody

Content Model:

\[(\text{CmdID}, \text{NoResp}? , \text{Cred}?, \text{Target}?, \text{Source}?, \text{Meta}?, (\text{Add} | \text{Atomic} | \text{Copy} | \text{Delete} | \text{Sequence} | \text{Replace})*)\]

Attributes: None.

<!-- End of DTD Definition -->
8 WBXML Definition

The following tables define the token assignments for the mapping of the SyncML related DTDs and element types into WBXML as defined by [12].

### 8.1 Code Space Definitions

This version of the SyncML representation protocol specification maps all the SyncML related DTDs into a single WBXML code space.

<table>
<thead>
<tr>
<th>DTD Name</th>
<th>WBXML PUBLICID Token (Hex Value)</th>
<th>Formal Public Identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>SyncML</td>
<td>FD1</td>
<td>-//SYNCML//DTD SyncML 1.1//EN</td>
</tr>
</tbody>
</table>

The SyncML DTD is assigned the WBXML document public identifier (i.e., the "publicid" WBXML BNF production) associated with the FD1 token.

### 8.2 Code Page Definitions

The following code page tokens represent SyncML related DTD public identifiers. This version of the SyncML representation protocol specification utilizes the WBXML code page tokens for identifying DTDs.

<table>
<thead>
<tr>
<th>DTD Name</th>
<th>WBXML Code Page Token (Hex Value)</th>
<th>Formal Public Identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>SyncML</td>
<td>00</td>
<td>-//SYNCML//DTD SyncML 1.1//EN</td>
</tr>
<tr>
<td>MetInf</td>
<td>01</td>
<td>-//SYNCML//DTD MetInf 1.1//EN</td>
</tr>
</tbody>
</table>

### 8.3 Token Definitions

The following WBXML token codes represent element types (i.e., tags) form code page x00 (zero), SyncML DTD.

<table>
<thead>
<tr>
<th>Element Type Name</th>
<th>WBXML Tag Token (Hex Value)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>05</td>
</tr>
<tr>
<td>Alert</td>
<td>06</td>
</tr>
<tr>
<td>Archive</td>
<td>07</td>
</tr>
<tr>
<td>Atomic</td>
<td>08</td>
</tr>
<tr>
<td>Chal</td>
<td>09</td>
</tr>
<tr>
<td>Cmd</td>
<td>0A</td>
</tr>
<tr>
<td>CmdID</td>
<td>0B</td>
</tr>
<tr>
<td>CmdRef</td>
<td>0C</td>
</tr>
<tr>
<td>Copy</td>
<td>0D</td>
</tr>
<tr>
<td>Cred</td>
<td>0E</td>
</tr>
<tr>
<td>Data</td>
<td>0F</td>
</tr>
<tr>
<td>Delete</td>
<td>10</td>
</tr>
<tr>
<td>Exec</td>
<td>11</td>
</tr>
<tr>
<td>Final</td>
<td>12</td>
</tr>
<tr>
<td>Get</td>
<td>13</td>
</tr>
<tr>
<td>Item</td>
<td>14</td>
</tr>
<tr>
<td>Lang</td>
<td>15</td>
</tr>
<tr>
<td>LocName</td>
<td>16</td>
</tr>
<tr>
<td>LocURI</td>
<td>17</td>
</tr>
</tbody>
</table>
The WBXML token codes from code page x01 (one) represent the MetaInf DTD. These token definitions are defined in the MetaInf DTD specification [10].
9 Common URI Scheme Types

The following is a list of common URI scheme types

<table>
<thead>
<tr>
<th>URI Scheme Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FTP</td>
<td>File Transfer Protocol</td>
</tr>
<tr>
<td>HTTP</td>
<td>Hypertext Transfer Protocol</td>
</tr>
<tr>
<td>IMEI</td>
<td>International Mobile Equipment Identifier</td>
</tr>
<tr>
<td>LDAP</td>
<td>Lightweight Directory Access Protocol</td>
</tr>
<tr>
<td>OBEX</td>
<td>IrDA Object Exchange Protocol</td>
</tr>
<tr>
<td>SYNCML</td>
<td>SyncML specific, as defined in one of the protocol or format specifications</td>
</tr>
<tr>
<td>WSP</td>
<td>Wireless Session Protocol</td>
</tr>
</tbody>
</table>
# 10 Base Media Types

The following common, base media types that are referenced by this specification. Any other IANA registered media type can be conveyed by SyncML.

<table>
<thead>
<tr>
<th>Media Type</th>
<th>Name</th>
<th>URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>application/vnd.synmlin-devinf+xml</td>
<td>SyncML Device Info v1.1 (clear text xml)</td>
<td><a href="http://www.syncml.org/docs/syncml_devinf_v11_20020213.pdf">http://www.syncml.org/docs/syncml_devinf_v11_20020213.pdf</a></td>
</tr>
<tr>
<td>application/vnd.synmlin-devinf+wbxml</td>
<td>SyncML Device Info v1.1 (wbxml)</td>
<td><a href="http://www.syncml.org/docs/syncml_devinf_v11_20020213.pdf">http://www.syncml.org/docs/syncml_devinf_v11_20020213.pdf</a></td>
</tr>
<tr>
<td>Text/plain</td>
<td>Plain Text</td>
<td><a href="http://www.ietf.org/rfc/rfc2046.txt">http://www.ietf.org/rfc/rfc2046.txt</a></td>
</tr>
<tr>
<td>application/vnd.synmlin-xcard</td>
<td>XML vCard v3.0</td>
<td>TBD</td>
</tr>
<tr>
<td>Text/x-vcalendar</td>
<td>vCalendar</td>
<td><a href="http://www.imc.org/pdi/vcal-10.doc">http://www.imc.org/pdi/vcal-10.doc</a></td>
</tr>
<tr>
<td>Text/calendar</td>
<td>iCalendar</td>
<td><a href="http://www.ietf.org/rfc/rfc2445.txt">http://www.ietf.org/rfc/rfc2445.txt</a></td>
</tr>
<tr>
<td>application/vnd.syncmlin-xcal</td>
<td>XML iCalendar</td>
<td>TBD</td>
</tr>
<tr>
<td>Text/message</td>
<td>MIME Message</td>
<td><a href="http://www.ietf.org/rfc/rfc2045.txt">http://www.ietf.org/rfc/rfc2045.txt</a></td>
</tr>
<tr>

# 11 Response Status Codes

The response status codes in SyncML are a numeric text value. The codes are divided into five classes. The only valid values are the standard values defined in this specification.

Implementations that desire to add to these values SHOULD submit a change request to mailto:syncml@syncml.org.

<table>
<thead>
<tr>
<th>Status Codes</th>
<th>Reason Phrase</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Informational 1xx</strong></td>
<td></td>
</tr>
<tr>
<td>101</td>
<td>In progress. The specified SyncML command is being carried out, but has not yet completed.</td>
</tr>
<tr>
<td><strong>Successful 2xx</strong></td>
<td></td>
</tr>
<tr>
<td>200</td>
<td>OK. The SyncML command completed successfully.</td>
</tr>
<tr>
<td>201</td>
<td>Item added. The requested item was added.</td>
</tr>
<tr>
<td>202</td>
<td>Accepted for processing. The request to either run a remote execution of an application or to alert a user or application was successfully performed.</td>
</tr>
<tr>
<td>203</td>
<td>Non-authoritative response. The request is being responded to by an entity other than the one targeted. The response is only to be returned when the request would have been resulted in a 200 response code from the authoritative target.</td>
</tr>
<tr>
<td>204</td>
<td>No content. The request was successfully completed but no data is being returned. The response code is also returned in response to a Get when the target has no content.</td>
</tr>
<tr>
<td>205</td>
<td>Reset content. The source should update their content. The originator of the request is being told that their content should be synchronized to get an up to date version.</td>
</tr>
<tr>
<td>206</td>
<td>Partial content. The response indicates that only part of the command was completed. If the remainder of the command can be completed later, then when completed another appropriate completion request status code SHOULD be created.</td>
</tr>
<tr>
<td>207</td>
<td>Conflict resolved with merge. The response indicates that the request created a conflict; which was resolved with a merge of the client and server instances of the data. The response includes both the Target and Source URLs in the Item of the Status. In addition, a Replace command is returned with the merged data.</td>
</tr>
<tr>
<td>208</td>
<td>Conflict resolved with client’s command &quot;winning&quot;. The response indicates that there was an update conflict; which</td>
</tr>
</tbody>
</table>
was resolved by the client command winning.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>209</td>
<td>Conflict resolved with duplicate. The response indicates that the request created an update conflict; which was resolved with a duplication of the client’s data being created in the server database. The response includes both the target URI of the duplicate in the Item of the Status. In addition, in the case of a two-way synchronization, an Add command is returned with the duplicate data definition.</td>
</tr>
<tr>
<td>210</td>
<td>Delete without archive. The response indicates that the requested data was successfully deleted, but that it was not archived prior to deletion because this optional feature was not supported by the implementation.</td>
</tr>
<tr>
<td>211</td>
<td>Item not deleted. The requested item was not found. It may have been previously deleted.</td>
</tr>
<tr>
<td>212</td>
<td>Authentication accepted. No further authentication is needed for the remainder of the synchronization session. This response code can only be used in response to a request in which the credentials were provided.</td>
</tr>
<tr>
<td>213</td>
<td>Chunked item accepted and buffered.</td>
</tr>
<tr>
<td>214</td>
<td>Operation cancelled. The SyncML command completed successfully, but no more commands will be processed within the session.</td>
</tr>
<tr>
<td>215</td>
<td>Not executed. A command was not executed, as a result of user interaction and user chose not to accept the choice.</td>
</tr>
<tr>
<td>216</td>
<td>Atomic roll back OK. A command was inside Atomic element and Atomic failed. This command was rolled back successfully.</td>
</tr>
</tbody>
</table>

**Redirection 3xx**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>300</td>
<td>Multiple choices. The requested target is one of a number of multiple alternatives requested target. The alternative SHOULD also be returned in the Item element type in the Status.</td>
</tr>
<tr>
<td>301</td>
<td>Moved permanently. The requested target has a new URI. The new URI SHOULD also be returned in the Item element type in the Status.</td>
</tr>
<tr>
<td>302</td>
<td>Found. The requested target has temporarily moved to a different URI. The original URI SHOULD continue to be used. The URI of the temporary location SHOULD also be returned in the Item element type in the Status. The requestor SHOULD confirm the identity and authority of the temporary URI to act on behalf of the original target URI.</td>
</tr>
</tbody>
</table>
| 303  | See other. The requested target can be found at another
<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>304</td>
<td>Not modified. The requested SyncML command was not executed on the target. This is an additional response that can be added to any of the other Redirection response codes.</td>
</tr>
<tr>
<td>305</td>
<td>Use proxy. The requested target MUST be accessed through the specified proxy URI. The proxy URI SHOULD also be returned in the Item element type in the Status.</td>
</tr>
</tbody>
</table>

**Originator Exceptions 4xx**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400</td>
<td>Bad request. The requested command could not be performed because of malformed syntax in the command. The malformed command MAY also be returned in the Item element type in the Status.</td>
</tr>
<tr>
<td>401</td>
<td>Invalid credentials. The requested command failed because the requestor MUST provide proper authentication. If the property type of authentication was presented in the original request, then the response code indicates that the requested command has been refused for those credentials.</td>
</tr>
<tr>
<td>402</td>
<td>Payment required. The requested command failed because proper payment is required. This version of SyncML does not standardize the payment mechanism.</td>
</tr>
<tr>
<td>403</td>
<td>Forbidden. The requested command failed, but the recipient understood the requested command. Authentication will not help and the request SHOULD NOT be repeated. If the recipient wishes to make public why the request was denied, then a description MAY be specified in the Item element type in the Status. If the recipient does not wish to make public why the request was denied then the response code 404 MAY be used instead.</td>
</tr>
<tr>
<td>404</td>
<td>Not found. The requested target was not found. No indication is given as to whether this is a temporary or permanent condition. The response code 410 SHOULD be used when the condition is permanent and the recipient wishes to make this fact public. This response code is also used when the recipient does not want to make public the reason for why a requested command is not allowed or when no other response code is appropriate.</td>
</tr>
<tr>
<td>405</td>
<td>Command not allowed. The requested command is not allowed on the target. The recipient SHOULD return the allowed command for the target in the Item element type in the Status.</td>
</tr>
<tr>
<td>406</td>
<td>Optional feature not supported. The requested command failed because an optional feature in the request was not supported. The unsupported feature SHOULD be specified</td>
</tr>
<tr>
<td>Status Code</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>407</td>
<td>Missing credentials. This response code is similar to 401 except that the response code indicates that the originator MUST first authenticate with the recipient. The recipient SHOULD also return the suitable challenge in the Chal element type in the Status.</td>
</tr>
<tr>
<td>408</td>
<td>Request timeout. An expected message was not received within the required period of time. The request can be repeated at another time. The RespURI can be used to specify the URI and optionally the date/time after which the originator can repeat the request. See RespURI for details.</td>
</tr>
<tr>
<td>409</td>
<td>Conflict. The requested failed because of an update conflict between the client and server versions of the data. Setting of the conflict resolution policy is outside the scope of this version of SyncML. However, identification of conflict resolution performed, if any, is within the scope.</td>
</tr>
<tr>
<td>410</td>
<td>Gone. The requested target is no longer on the recipient and no forwarding URI is known.</td>
</tr>
<tr>
<td>411</td>
<td>Size required. The requested command MUST be accompanied by byte size or length information in the Meta element type.</td>
</tr>
<tr>
<td>412</td>
<td>Incomplete command. The requested command failed on the recipient because it was incomplete or incorrectly formed. The recipient SHOULD specify the portion of the command that was incomplete or incorrect in the Item element type in the Status.</td>
</tr>
<tr>
<td>413</td>
<td>Request entity too large. The recipient is refusing to perform the requested command because the requested item is larger than the recipient is able or willing to process. If the condition is temporary, the recipient SHOULD also include a Status with the response code 418 and specify a RespURI with the response URI and optionally the date/time that the command SHOULD be repeated.</td>
</tr>
<tr>
<td>414</td>
<td>URI too long. The requested command failed because the target URI is too long for what the recipient is able or willing to process. This response code is seldom encountered, but is used when a recipient perceives that an intruder may be attempting to exploit security holes or other defects in order to threaten the recipient.</td>
</tr>
<tr>
<td>415</td>
<td>Unsupported media type or format. The unsupported content type or format SHOULD also be identified in the Item element type in the Status.</td>
</tr>
<tr>
<td>416</td>
<td>Requested size too big. The request failed because the specified byte size in the request was too big.</td>
</tr>
<tr>
<td>Status Code</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>417</td>
<td>Retry later. The request failed at this time and the originator should retry the request later. The recipient SHOULD specify a <strong>RespURI</strong> with the response URI and the date/time that the command SHOULD be repeated.</td>
</tr>
<tr>
<td>418</td>
<td>Already exists. The requested <strong>Put</strong> or <strong>Add</strong> command failed because the target already exists.</td>
</tr>
<tr>
<td>419</td>
<td>Conflict resolved with server data. The response indicates that the client request created a conflict; which was resolved by the server command winning. The normal information in the <strong>Status</strong> should be sufficient for the client to &quot;undo&quot; the resolution, if it is desired.</td>
</tr>
<tr>
<td>420</td>
<td>Device full. The response indicates that the recipient has no more storage space for the remaining synchronization data. The response includes the remaining number of data that could not be returned to the originator in the <strong>Item</strong> of the <strong>Status</strong>.</td>
</tr>
<tr>
<td>421</td>
<td>Unknown search grammar. The requested command failed on the server because the specified search grammar was not known. The client MUST re-specify the search using a known search grammar.</td>
</tr>
<tr>
<td>422</td>
<td>Bad CGI Script. The requested command failed on the server because the CGI scripting in the <strong>LocURI</strong> was incorrectly formed. The client SHOULD re-specify the portion of the command that was incorrect in the <strong>Item</strong> element type in the <strong>Status</strong>.</td>
</tr>
<tr>
<td>423</td>
<td>Soft-delete conflict. The requested command failed because the &quot;Soft Deleted&quot; item was previously &quot;Hard Deleted&quot; on the server.</td>
</tr>
<tr>
<td>424</td>
<td>Size mismatch. The chunked object was received, but the size of the received object did not match the size declared within the first chunk.</td>
</tr>
</tbody>
</table>

**Recipient Exception 5xx**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>500</td>
<td>Command failed. The recipient encountered an unexpected condition which prevented it from fulfilling the request</td>
</tr>
<tr>
<td>501</td>
<td>Command not implemented. The recipient does not support the command required to fulfill the request. This is the appropriate response when the recipient does not recognize the requested command and is not capable of supporting it for any resource.</td>
</tr>
<tr>
<td>502</td>
<td>Bad gateway. The recipient, while acting as a gateway or proxy, received an invalid response from the upstream recipient it accessed in attempting to fulfill the request.</td>
</tr>
<tr>
<td>503</td>
<td>Service unavailable. The recipient is currently unable to...</td>
</tr>
<tr>
<td>Status Code</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>504</td>
<td>Gateway timeout. The recipient, while acting as a gateway or proxy, did not receive a timely response from the upstream recipient specified by the URI (e.g. HTTP, FTP, LDAP) or some other auxiliary recipient (e.g. DNS) it needed to access in attempting to complete the request.</td>
</tr>
<tr>
<td>505</td>
<td>DTD Version not supported. The recipient does not support or refuses to support the specified version of SyncML DTD used in the request SyncML Message. The recipient MUST include the versions it does support in the Item element type in the Status.</td>
</tr>
<tr>
<td>506</td>
<td>Processing error. An application error occurred while processing the request. The originator should retry the request. The RespURI can contain the URI and date/time after which the originator can retry the request.</td>
</tr>
<tr>
<td>507</td>
<td>Atomic failed. The error caused all SyncML commands within an Atomic element type to fail.</td>
</tr>
<tr>
<td>508</td>
<td>Refresh required. An error occurred that necessitates a refresh of the current synchronization state of the client with the server. Client is requested to initiate a slow sync with the server.</td>
</tr>
<tr>
<td>509</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>510</td>
<td>Data store failure. An error occurred while processing the request. The error is related to a failure in the recipient data store.</td>
</tr>
<tr>
<td>511</td>
<td>Server failure. A severe error occurred in the server while processing the request. The originator SHOULD NOT retry the request.</td>
</tr>
<tr>
<td>512</td>
<td>Synchronization failed. An application error occurred during the synchronization session. The originator should restart the synchronization session from the beginning.</td>
</tr>
<tr>
<td>513</td>
<td>Protocol Version not supported. The recipient does not support or refuses to support the specified version of the SyncML Synchronization Protocol used in the request SyncML Message. The recipient MUST include the versions it does support in the Item element type in the Status.</td>
</tr>
<tr>
<td>514</td>
<td>Operation cancelled. The SyncML command was not completed successfully, since the operation was already cancelled before processing the command. The originator...</td>
</tr>
<tr>
<td>Status Code</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>516</td>
<td>Atomic roll back failed. Command was inside <strong>Atomic</strong> element and <strong>Atomic</strong> failed. This command was not rolled back successfully. Server should take action to try to recover client back into original state.</td>
</tr>
</tbody>
</table>

should repeat the command in the next session.
12 Alert Types

The alert types in SyncML are a numeric text value. The types are divided into two classes, User Alert, that are intended to be conveyed to the recipient's user agent, and Application Alert, that are intended to be conveyed to a target application on the recipient. The only valid values are the standard values defined in this specification.

Implementations that desire to add to these values SHOULD submit a change request to mailto:syncml@syncml.org.

### Special Alert Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>221</td>
<td>RESULT ALERT</td>
<td>Specifies a request for synchronization results.</td>
</tr>
<tr>
<td>222</td>
<td>NEXT MESSAGE</td>
<td>Specifies a request for the next message in the package.</td>
</tr>
<tr>
<td>223</td>
<td>NO END OF DATA</td>
<td>End of Data for chunked object not received.</td>
</tr>
</tbody>
</table>

#### User interaction Alert Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>1100</td>
<td>DISPLAY</td>
<td>The Alert is sent by the server and the client should display the message to provide information to the user.</td>
</tr>
<tr>
<td>1101</td>
<td>CONTINUE OR ABORT</td>
<td>This Alert is sent by the server and the client should display the message sent by the server and ask for confirmation. If the user doesn't confirm the operation, abort code MUST be sent back.</td>
</tr>
<tr>
<td>1102</td>
<td>TEXT INPUT</td>
<td>The terminal displays the message sent inside the Alert then allows the user to type in a text string. This text string is then sent back to the server in a Status message.</td>
</tr>
<tr>
<td>1103</td>
<td>SINGLE CHOICE</td>
<td>The user is presented a set of choices from which he or she is allowed to select only one.</td>
</tr>
<tr>
<td>1104</td>
<td>MULTIPLE CHOICE</td>
<td>The user is presented a set of choices from which he or she is allowed to select one or more.</td>
</tr>
</tbody>
</table>

#### Device management session Alert Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>1200</td>
<td>SERVER-INITIATED MGMT</td>
<td>Specifies a server-initiated management session.</td>
</tr>
<tr>
<td>1201</td>
<td>CLIENT-INITIATED MGMT</td>
<td>Specifies a client-initiated management session.</td>
</tr>
</tbody>
</table>

#### Special device management Alert Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>1221</td>
<td>RESULT ALERT</td>
<td>Specifies a request for management action results.</td>
</tr>
<tr>
<td>1222</td>
<td>NEXT MESSAGE</td>
<td>Specifies a request for the next message in the package. Alert 1222 follows the same rules as the synchronization Alert 222.</td>
</tr>
<tr>
<td>Code</td>
<td>Description</td>
<td>Details</td>
</tr>
<tr>
<td>----------</td>
<td>--------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>1223</td>
<td>SESSION ABORT</td>
<td>Informs the other party that the originator wants to break management session. Response is ignored and the session ends</td>
</tr>
<tr>
<td>1224-1299</td>
<td>-</td>
<td>Reserved for future SyncML usage.</td>
</tr>
</tbody>
</table>
